Can anyone explain why Pagestream is SOOOOOOO SLOOOOOOOW. Its not as if it doe-
s anything radicly different from Calamus oes
anything radically different from all the other DTP packages, so why does it l-
oload and run so slowly?

2. Re: GFA basic and STEs

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-01 02:00:49 UTC
From: ksommerville@cix.compulink.co.uk
Message-ID: <1992Jan01.020049.7840@demon.co.uk>
Source record: 46254

Sounds a bit stupid to me. GFA 3.6 runs fine on a Mega ST and STFM (Tos 1.0
Tos'es 1.0 and 1.2. GFA have a good record with their upgrades. The only prob-
lem is
problem will be that the STFM wont use some of the new commands to do with sou-
nd and so
sound and so on.

3. AUTO Folder Programs -- How do they replace system functions?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-01 04:24:40 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <TRsuDB2w164w@ersys.edmonton.ab.ca>
Source record: 46255
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

For a long time, I've been wanting to replace one of the ST functions with one of my own. For example, a critical error handler that tells you what the error is in words, and what might have caused the problem. Or I'd like to be able to press a key from the desktop and run a program. Or even just make the screen invert colors after a period of mouse inactivity. The point is that the method of doing this escapes me. The screen inverter could be done with an accessory, but that would waste a slot. I suppose a practical example might be this:

When the user presses TAB from a GEM program, an alert appears telling the total ammount of free memory available. Again, this could be done using an accessory, but it shouldn't have to be. I've seen all kinds of programs that install themselves in the AUTO folder and activate themselves when a key is pressed.

Does anyone know how I could do this? I use Personal Pascal mainly for programming, but I also have access to Sozobon C and Modula-2. Or even assemmbly, although I can't write anything in assemmbly. The assembler is the german Shareware one recently released.

If you are willing o wait a little while, try Calamus SL with the new
Dataformer module. This will let you produce Postscript output.
It still won't let you use PS-fonts anyway, but who cares?

Calamus SL is shipped here in Germany and the Dataformer will be shipped
RSN, whatever that exactly means :-)

Cheers, Paddy

This (and the other recent DTP discussion) is not a proper question for
the .tech newsgroup, so I've crossposted this answer to comp.sys.atari.st
and ask that any further discussion take place there.

I don't regard PageStream as ``SOOOOOOO SLOOOOOOOW'' in comparison to
similar PostScript-capable programs running on other comparable machines.
In fact, if you'll go spend some time playing with PageMaker on a PC
running Windows with anything less than a '386-16, you'll come to regard
PageStream a a real piece of greased lightning. You'll also come to regard
PageStream as a very capable, very stable program that need not be
embarrassed in any crowd.

Calamus is a very different animal. It uses a single proprietary imaging
method to generate screen and output images. This is much simpler than
having to support several different output methods, as does PageStream.
The program's internal data representation can be more closely matched
to the standardized output. The result is that Calamus can generate
pages faster than PageStream -- in fact, faster than any other publishing
program I've seen on any computer -- but it comes at a cost, which is
the well-known and oft-lamented inability of Calamus to drive industry-
standard PostScript devices.

Issue #9153 of Z*Net, one of the weekly online Atari magazines, has an
excerpt from the Seybold Report on Desktop Publishing that is worth reading
if you're interested in desktop publishing on Atari hardware. The file
can be obtained from atari.archive.umich.edu.

6. TERMCAP

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-02 05:26:53 UTC
From: gkessells@cc.curtin.edu.au
Message-ID: <1992Jan2.142653.11052@cc.curtin.edu.au>
Source record: 46192

Could anyone out there post me, or point me in the direction of a termcap file suitable for the ST, with instructions on what enviro variables etc. to set. I am using MINT with TCSH and ELVIS and have had no luck getting the arrow keys to work for the TCSH history.

Thanks, Rob.

7. spu2spc on Unix? need source code

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-02 05:32:00 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <12467@vela.acs.oakland.edu>
Source record: 46259

I just picked up a nice program for the ST GEM that is called spu2spc
and is part of a package called DMJ. I have been using pbmplus to
convert my pictures to spu format, and I was wondering if anyone knew
of any unix based programs that would do the conversion from either
gif to spc or from spu to spc? Preferably with less speckling than
either giftospu (pbmplus - not part of Jef Poskansers original package)
or DMJ.TOS.

Thanks
swood

> thete anything else I not supposed to do ?

Don't call an AES Event Manager function while holding an open file handle.
Close the file and reopen it later if needed.

Don't use *any* stream i/o functions if you're programming with Sozobon;
there are dynamic memory allocation calls buried deep inside the dLibs
library. Use GEMDOS Fopen/Fread/Fclose instead.

Don't get real crazy with recursion. Most DA startup code uses a fairly
small stack.

> Can I load a resource file for example ??

You can load one while initializing the DA, but why not just build it into
the DA? If your resource editor won't write .C files, there are a couple
of RSC-to-C converters at atari.archive.

Well, as you say you could use evnt_keybd() to do this from an ACC. To do
this from an AUTO program, would, I beleive require you to intercept the
TAB keypress.This would prevent the TAB from getting to the GEM program
which you said we were running. I think the best way is to have it as an
ACC and then evnt_keybd() (or evnt_multi()) for something such as
alt-TAB, this way, because no program I no of uses alt-TAB you don't have
to worry about interceppting it...

12. Sozobon 1.33 / 2.0

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-02 21:12:01 UTC
From: bill@mwca.UUCP
Message-ID: <1949@mwca.UUCP>
Source record: 46264

Now that there are two "new" versions of Sozobon C, can someone (Steve Y, I presume) detail what the benefits are of each version? As I understand it V1.33 is the "plug-n-play" version which is more easily configured and used from GEM, but V2.0 has more bug fixes and optimization?

Also, is there any sort of support being worked on for a source level debugger?

13. _fstat and sozobon stat.h - any hope here???

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-03 07:23:05 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <12483@vela.acs.oakland.edu>
Source record: 46265
Cross-posted to: comp.sys.atari.st.tech,comp.lang.c

I am currently using Sozobon 2.0 on an Atari ST and I am looking for
some way of invoking the function fstat. Its form is something like:

fstat(fd, *buf);

where fd is pointing the file you want information from and buf struct stat

Mainly, the portions of the struct that I need are; st_size (file size)
and st_mtime (last modification time/date)

If anyone has seen my previous post, I am trying to port the bsd version
of monop (text monopoly game) and the save/restore options require calls
to stat() and fstat() but of course fstat is not supported on the ST and
I am getting compiling errors. I have tried subverting the save/restore
routines, but had no luck on the first try. I will try again tomorrow, but
in the meantime, I would like to try to save them.

My next big task is getting strcasecmp() to work with sozobon, and I will
be all set.

Perhaps, but the idea is to create a program that does this without using
up an .ACC slot. There are only six of them, so it wouldn't be a good
idea to waste one on a trivial task. Aside from that consideration, I
also talked about other programs that couldn't function as accessories,
such as a program that allows you to replace the file selector with one
of your own choosing. The best solution for this would be to tell the
system that the file selector routine is not at the default location, and
then terminate execution using the ptermres() system command so that the
memory occupied by the alternate selector is not erased or used by
another program. The only question is how to tell the system to jump to
a different location when it needs the file selector. This is only one
example. Hotkeys from the desktop should also be possible, but how do
you tell the system to wait for a keypress, and then to execute a program
when one is found. I suppose what I am looking for is a book that would
tell me all of this information, or as much as is available.

15. Help!

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-03 10:57:35 UTC
From: murray@status.gen.nz
Message-ID: <omXZDB1w164w@status.gen.nz>
Source record: 46301

I wonder if any of you GEM gurus out there can help me with a little programming problem I've got.

I'm writing a Desk Accessory which uses dialog boxes, and is designed to be run specifically from within Flash. When you call it up, it displays a dialog box and lets you use it (using the normal sequence of calls; form_dial to reserve the screen area, objc_draw to draw the dialog box, form_do to handle the input, and then form_dial again to release the screen area). I then bring up another dialog box which says "Please wait..." while my prog does something.

My problem is that the first dialog box doesn't disappear from the screen; the second one just appears over the top of the first. I thought the last form_dial was meant to send re-draw messages to Flash so it can re-draw its screen?? When I run my DA from Neodesk everything works ok, so maybe there's something wrong with Flash? But I've noticed that it still acts funny when I run it from within other programs other than Flash. Do I have to somehow pause or something to give Flash a chance to redraw the screen?

>Well, as you say you could use evnt_keybd() to do this from an ACC. To do

This would not work because keypress events goes to the owner of the top window... Which means that the accessory need to have a window open - and topped.

>this from an AUTO program, would, I beleive require you to intercept the
>TAB keypress.This would prevent the TAB from getting to the GEM program
>which you said we were running.

Exactly how would you make your resident program do an alert? To make an AES call you need to have an ap_id - which you can't get (beeing resident)!

You may now ask how the 'critical event (sp?)' work, you know the alert that says something along the lines "Your drive is not responding[retry|cancel]" (this vector is called from BIOS level, and the standard routine calls AES). I think that it is a dangerous hack which should not be copied, as a lesson you could try to force the alert from the file selector on pre TOS 1.04 machines (fx by removing the disc from the drive)...

> from GEM, but V2.0 has more bug fixes and optimization?

Not exactly. I haven't run any tests yet, but I suspect that 2.0 isn't as
good as 1.33 at optimization, and I'm fairly certain that 1.33i has been
combed more thoroughly for bugs.

The single advantage of 2.0 that I can see is that it introduces a new
object file/library format that allows unlimited length for external
identifiers. Version 1.33i sticks to the old Alcyon/DRI format, in which
only eight characters are significant at the asm level and seven at the
C level.

1.33i features:
* a new and much improved MAKE
* an extensively rewritten and much faster assembler,
* configurable i/o buffers for optimum compiler performance
* a CC that runs from the Desktop,
* GEM libraries and GEM example source code,
* a couple of alternative startup modules,
* a smarter preprocessor that understands quite a bit of ANSI stuff,
* support for longer source lines,
* ANSI concatenation of adjacent string literals
* some useful #pragma instructions
* C++ comments
* full support for void *pointers
* plain English error messages
* a bunch of dLibs fixes
* better documentation of compiler quirks and shortcomings.

> Also, is there any sort of support being worked on for a source level
> debugger?

I don't think so, although I don't know what the original Sozobon team
is doing.

I believe Ian Lepore's priorities center around adding the new extended
object file format to 1.33i, completing the transformation of the
preprocessor to the ANSI standard, and support for function prototypes.
He also has some code written to support 32-bit ints, which could require
some reworking of GEMFAST as well as a recompiling of dLibs.

dave@babelfish.ericsson.se (David Potts) writes:

>I writting a desk accessory, I known that I can't allocate any memory, is
>thete anything else I not supposed to do ?

Ofcause you can Malloc memory, but ONLY if the GEMDOS PID is the same as when
the program was started! This works for Accessorys (can allocate memory on
the desktop), for programs (ofcause!), and for a imaginary(sp?) TOS that gives
each ACC their own GEMDOS PID.

>Can I load a resource file for example ??
In the docs to GEM 2 and 3 it says that you can't! (mustn't)

You mustn't claim vectors and if you do remember XBRA!
You mustn't set up a cookie!

It should be clear that accessorys aren't full blown programs - In fact an
accessorys don't have a basepage!
The basepage contains information about the current DTA and default path and
drive (normally one set for each process). When allocating memory and
opening files the basepage address is used as the PID of the owner. This means
that the currently running application will be billed when an accessory open a
file or allocates memory.
With this said, it shouldn't surprice that it is an bad idea to:

o change the DTA. If all you want to use the DTA for is to check the size
of a file then it is much better to use :

```
if ((f=Fopen) > 6)
{ lenght = Fseek(f,FROMEND,0);
Fseek(f,FROMSTART,0);
...
Fclose(f);
}
```

note that Fseek() returns the absolute position in the file, and when
you search 0 bytes from the end, then the absolute position is the
length.

o change the path or drive. Instead allways use the full path.

o allocate memory when not on the desktop.

The following also applies to normal GEM programs:

- Remember to use wind_update() with BEG_UPDATE before you write on the
screen and with END_UPDATE after. The BEG_UPDATE will tell AES that
it shouldn't send redraw messages or let another process write on the

screen (it is doing this by letting all processes hang and wait when
they do a BEG_UPDATE and there allready is one updating the screen).
Do this to avoid an other process smears the screen (eg ScreenMgr)

- When you use the VDI, then remember to get the handle for the
Screen from the AES, with graf_handle(). It is really painfull
to use a program that don't, when AMCGDOS is installed:

"Your application uses illigal handles!",

- Don't use ScanCodes to check for any key on the main keyboard, use them
only to check for HELP, UNDO, F1-10, ESC ...
Don't use them for 'Z', 'Y', '[', or any other key. If you use ALT+key,
then use the BIOS KeyBoardTable to convert the scancode to ASCII, then
check that.
Don't replace the build-in Keyboardtable ('cept if that is what your program
is supposed to do).

- Don't assume that because you only have one window, that you then don't
have to process WM_REDRAW or VM_TOP/WM_NEWTOP messages.

- When you Allocate memory, then remember to leave some (8Kb+) for AES,
VDI, GEMDOS, and accessorys. On a related subject, don't :

p = Malloc((long) int_var);

This will work if int_var is less than 32Kb, else it will fail big!

- Don't mix BIOS/GEMDOS screen output (input?) with a Gem program. There
might be graphics cards that jump into textmode when it is told to
output text like (PC's).

- Stop using the LineA routines.

What about a FAQ? This question is asked ones every month.

-Klaus

19. writing an assembler for the M68000 - advice wanted

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-03 18:23:46 UTC
From: scoile@gmuvax2.gmu.edu
Message-ID: <1992Jan3.182346.21539@gmuvax2.gmu.edu>
Source record: 46268

Have any of you out there ever tried writing an assembler for the 68000? I've been trying to figure out HOW it could be easily done, but it just DOESN'T seem possible!

The problem is the seemingly random method with which the opcodes are setup.

How does one go about writing an assembler for the 68000? I've considered writing a seperate set of routines for each instructions, but that would be a rediculous waste of space. What I'd LIKE to do is come up with some sort of descriptive language for the whole thing, which would describe how each instruction should be parsed, and the correct syntax and resulting opcodes for each, but this seems nearly impossible, given the wacky layout of the op-codes.

Could SOMEONE *PLEASE* shed some light on what needs to happen here?!?!?! PLEASE!!!

20. addresses of system-fonts

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-03 18:39:33 UTC
From: zwq017@dmswwu1c.BITNET
Message-ID: <030192.193933ZWQ017@DMSWWU1C.BITNET>
Source record: 46293

Hello,

does anybody know how I can get the address of the array in which the
pointer to the system-fonts (font_hdr) are stored? This address is
returned in some registers when I call linea0, but new programs should
not use linea any more, should they? Is there any legal way?
Thanks.

21. Re: _fstat and sozobon stat.h - any hope here???

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-03 19:11:20 UTC
From: steve@thelake.mn.org
Message-ID: <A1768560675@thelake.mn.org>
Source record: 46084
Cross-posted to: comp.sys.atari.st.tech,comp.lang.c

Note: I've left this crossposted to comp.lang.c because someone who's dealt with the issue of implementing fstat on a foreign operating system, such as MS-DOS or another CP/M cousin, might have something useful to contribute. Atari-specific followups should be directed only to comp.sys.atari.st.tech.

[In article <12483@vela.acs.oakland.edu>, swood@vela.acs.oakland.edu (EVENSONG) writes ...]

> I am currently using Sozobon 2.0 on an Atari ST and I am looking for

>
> fstat(fd, *buf);
>
> where fd is pointing the file you want information from and buf struct stat
>
> Mainly, the portions of the struct that I need are; st_size (file size)
> and st_mtime (last modification time/date)

GEMDOS doesn't provide an equivalent to fstat(). Implementing a full-blown replacement isn't impossible, but it would involve quite a bit of rewriting of dLibs' low-level, Unix-like open/close functions to save some data not currently saved, and you probably don't want to root around that much in the C library source code.

(If you look at the dLibs implementation of stat(), you'll notice that it calls GEMDOS functions that want filenames, not file handles. One way of making the filename information available would be to modify open/close/etc. to maintain an internal table of filenames and file descriptors, so fstat could backtrack.)

There are two simpler and more practical solutions. Since all you need is the file size and the time stamp, you can either rewrite that portion of the application code you're porting from BSD, or write a bogus fstat that fills in only those two fields of the stat structure. The latter course, incidentally, is taken by Eric Smith's MiNT C library for GNU C.

GEMDOS provides a system call, Fdatime(int *timestamp; int fd; int flag) that will obtain the time stamp for an already opened file descriptor and store it in the pointed-to location. The proper value for ``flag'' in this case is 0; a 1 is used to set the timestamp. See osbind.h and the dLibs sources for examples of its usage.

To obtain the file size for an already-opened file, you can use the brute-force method: Record the file position, seek to the end, get the new

file position (which, of course, is the size), and seek back to the
original position.

> My next big task is getting strcasecmp() to work with sozobon, and I will
> be all set.

That should be simple if you can figure out what strcasecmp does. The
dLibs library probably already has that functionality in one of its str*
functions.

The opcode layout is actually very regular. If you think this is bad, don't ever think of writing for, say, an 8086...

Are you complaining that the mnemonics aren't in any good order, or that the binary opcodes don't make sense?

You should read up on using lex and yacc, that would solve much of your problem right away. Assembler syntax is one of the more trivial things you might ever want to write a description for... As for the opcode layout - just about all of the 68000 instructions are organized as (left to right) 1 4-bit field followed by 4 3-bit fields. If you intend to also support the 68010/68020 etc. you'll start running into more and more special cases, but so it goes.

From: wmagro@firenze.physics.uiuc.edu
Message-ID: <1992Jan3.223339.26068@ux1.cso.uiuc.edu>
Source record: 46270
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Does anyone know the scanning frequencies of the high res TT monitor, the TTM194?

I am thinking of buying a TT if I can get a mono monitor I have to work with
the TT in high res. $1000 for a mono monitor is too much for me...

Also, if you know the scanning frequencies for the other TT video modes,
in particular the VGA mode, please give those as well.

Thanks a bunch.

Johnathon Small asked about the Gadgets by Small Accelerator Board by
Gadgets by Small.
ST Format issue 27 Oct '91 has ran an article on it supplying the following
info:
Compatiblity - "The vast majority of applications work perfectly well... but
should a program crash it,it can be turned off froma pulldown menu."

Speed - "In terms of speed the board can outstrip a TT by about 25%. It can
speed up a std ST by a factor of about ten... The only computer Apple have
which can outrun an ST with SST fitted is their Cray X/MP."

Price - "The 33MHz board with a 68882 coprocessor and 4 MBytes of SIMM RAM
costs $800 (about 450 pounds). "

Supplier - Gadgets By Small, 40 W Littleton Blvd, #210-211, Littleton,
CO, 80120, USA. Ph 0101 303 791 6098, Fax 0101 303 791 0253.

Soundz a pretty good unit, though its a bit out of my price range at the mo
being roughly $1200 NZ, esp since I can't think of an immediate use for it.

I cribbed from some assemblers I'd seen in the past and used a table and a masking/matching scheme. The table basically translated

<opName><ea1><ea2>

into the instruction's based bit-pattern, plus information on how to build the rest of the instruction.

For instance, for MOVEP there would be three table entries:

(kMoveP, kDX, kdAY, <bit-pattern>, <instr-build-func>)
(kMoveP, kdAY, kDX, <bit-pattern>, <instr-build-func>)
(kBadInstr) /* fall-through, illegal addr mode */

where 'kMoveP' is the ID assigned the mnemonic "movep", kDX stands for the "Dx" addressing mode, and "kdAY" stands for the "(d,Ay)" addressing mode. The assembler trots down the table looking for a match against the current (parsed) source statement. When it finds a match, it calls the the instr-build-func to actually construct it. I ended up with around 40 instruction building functions.

I found it helpful to be able to type in the binary given in the back of the Motorola reference manual, and wrote a preprocessor to generate the C source for the table.

You can probably do better than this by abusing some parsing tool like yacc and feeding it binary gunk (the parsed mnemonic and the EAs) rather than text. You might get away with fewer instruction-building functions this way as well.

... why are you writing an assembler? Life is short!

27. TDI Modula-2 Library Sources Available? Help!

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-04 02:41:35 UTC
From: cordes@ac.dal.ca
Message-ID: <1992Jan3.224135.2740@ac.dal.ca>
Source record: 46273
Cross-posted to: comp.sys.atari.st.tech,comp.lang.modula2

I have recently rediscovered my TDI Modula-2 version 3.01 disks and I thought I might use Modula for a project which I am starting. I know that TDI appears to fallen off the planet, but does anyone out there have the SOURCES for their libraries. I know they were available at one time directly from TDI. I purchased the developer's version and every upgrade and just about everything TDI produced EXCEPT the sources for the libaries themselves. Would anyone have a copy they would care to sell?

I gave up on TDI Modula-2 a couple of years ago and pretty much moved to assembler for everything but the application I'm writing just begs for something like GRIDFILE so I thought I'd dust off Modula-2. There were some real quirks I'd like to fix, particularly in the GEMLIB but I'd also like to rewrite GEMX and produce a smaller kernel for quick and dirty utils. Something as simple as a HELLO.MOD minimal program comes out around 2K where I can do the same thing in assembler in 70 bytes. Anyway, I digress.

Alternatively, could someone point me to whoever has the rights to TDI Modula-2 now that TDI is defunct. Is Phil Camp still around or did he fall off the planet with TDI?

Any and all assistance would be appreciated. There have been some excellent looking Modula-2 implementations coming out of Europe, but most of what I've seen is in German and I'm a mono-lingual Canadian.

>A month went by before I got the chance to power up again.
>When I did, the hard disk spun up okay, but didn't go
>through the self test. I forget what the screen showed, if anything,
>when it warmed up, but it wasn't good. So I hit the boot button
>on the back of the CPU. No dice. Without the HD, it wouldn't boot.
>So I turned off the disk, rebooted w/o it.

i, too, have just encountered a similar problem. powering up my old sh204 results in spin-up but no initialization (led does not flash - it stays on for about 10 sec then goes off). it has nothing to do with whether i boot from hd or floppy since the ST is not even powered up at this point. i have had this drive since about 1987 or so.

i suspect some sort of hardware failure. i suspect the controller more than the drive itself. i plan a swap of the drives themselves between my megafile 60 and the sh204, if for no other reason than to get at the data on the 204 disk (or try to). note that i had the 204 LUN set to 1 and had it daisychained to a megafile 60 which worked for several months. then i made the mistake of powering down the entire system for a week. when i tried to reboot, this happened. another reason to keep systems on all the time?

i have also noticed that my mega 4 and megafile 60 are now acting up. if i power down and let the system cool off (say for several hours) then power up and reboot, i have to leave the system warm up for about 20 min before i can do anything. otherwise i get tos error 39 (out of memory) when i try to run any program from hard disk. tho i do not think i have a viral infection, this started happening literally overnight (some months ago). if i let the system warm up, all is well.

will reseating chips help here? the problem seems to be the megafile not the ST since booting without any hard disk works fine even when the mega is initially "cold". it sounds like a warped board or something else "thermal". my system is located in a room with a more or less constant temp of 72 to 78 degrees F. the mega sits on a power strip (one of those line filter thingies). the megafile sits on the mega and a sm124 sits on the megafile. the sh204 is off to the side. there are no obstructions in the rear, sides, or front of this "stack". i also have 1/4" spacers between the mega, megafile, and monitor to help improve airflow (the louvers on top of the mega and megafile).

i am also going to look at the boards in the sh204 to see if there are
any broken connections (fatigue?), either components or traces.

can anyone shed some light on this??? any other ideas???

Source record: 46276

I might be wrong, but the described symptem sounds like the drive's stepping
part is bad. I have two drives did that, and my ST277R is doing that now.
You would get the drive front light on continuously for awhile and it will trun
off, but the drive is not accessible. A good drive will spin-up at same time
the front light on a shorter time then a few flash as the stepper move the head
in and out to position the head on the boot sector, usually druing this stage
you will hear a clink-clink sound as the head moved in and out. I think if you
listen carefully, the trouble drive will not have this which means the head is
not moved. This usually caused by the stepper controller on the PCB, so swap
the controller will not do unless you swap the hard drive PCB.
As I stated, I might be wrong but this is not uncommon on older drive.

Source record: 46282

```
Well, my experience is a little different from Mr. Rosenkranz's.
Once my LED lights (almost immediately), it stays on permanently.
Here's the sequence:

SECONDS EVENTS
======= ========================================================================
0:00.0 (Time Zero) I turn the drive on.
LED comes on at full brightness.
Fan spins up, but it makes enough noise that I can't tell
if the drive spins up.

0:00.5 LED goes out for just an instant,
comes back on at ~half brightness.
There is a distinct "CLICK" somewhere in the drive box.

0:02.0 There is a soft "clunk" that seems to come from the drive itself.
Sounds almost like the heads stepping a small distance.

0:03.5 There is a soft "click" from somewhere in the drive box,
and the fan speeds up slightly.
-------------------------------------------------------------------------------
After that, all remains at a steady state.

What happens when I hit the boot button in this state is this:
[: floppy drive whine twice; screen flashes off and on; :]
This cycle takes maybe 5 or 10 seconds, and repeats forever.

Again, any suggestions on what the problem might be
and/or on what I can do to fix it will be greatly appreciated.

I think it'll be awfully slow, since you cannot speed up the ACIA without hardware modifications. Think of a simple ring system with 5 nodes. Since the hardware is too slow for a collision protocol (everyone puts data on the net when he wants to), you'll have to pass a token. This will screw up all the machines and the ring goes down when the first machine crashes. If you use Midi-Thru, you have the problem of inserting your own packets into the data stream and you'll have to do lots of buffer management. Midi is too slow for sending out a short query packet before a transfer -- if you do this on a 5-site-ring, it'll surely take at least 100 ms ... just to decide whether a new net command may be issued or not.

>I would like to know how many channels were used, transfer rates,
>possible bugs (lost data?), ease of implementation, what it was used
>for, etc.

What do you mean with "how many channels"? There's only one physical transfer channel in the ring (you get data from exactly one host and can only send to one further machine, unless you set up some additional hardware). How many channels you use on software level (for different services, like on Internet :-) is up to you. For a really simple network you won't need more than a control (dispatcher) and a data channel.

Daniel

P.S.: Yes ... I know ... it's a little negative-vision, but all the Midi-based networks were so slow that you couldn't reasonably work with them. Just imagine ... a newwork at 25 % of the speed of your floppy drive :-/

Source record: 46284

Hello,

Actually, this refers to the include files that I found on
atari.archive under Sozobon 1.2. I downloaded the new Sozobon 2.0 binaries,
there were no include files that I saw. So, the problem is, I don't have
a stdlib.h file which I assumed should be part of the system. I have code
from a book that supports Turbo C, C++, and ANSI C that has stdlib.h
as an include file, was this file missing from the archive? Could someone
send me a copy of it, nothing interesting compiles without it.

Thanks,

Stephan

Is Synsonics still around? It was an Atari repair/sales place on Commonwealth Ave. in Boston. The guy fixed my SC1224 quickly and cheaply about a year ago.

I post this because if it's still in business, I'd like to know about it.

I don't know if dlibs has it, but strcasecmp is a case-insensitive string comparison. I have also seen it called 'strcmpi'. One way I have seen to implement it was to declare an array of 256 bytes, store the ASCII character set in it, then change all the lower case letters in it to upper case (or vice versa -- anyway, you store one case twice.) Then, the strcmp routine, instead of directly comparing the letters in two strings, uses those letters as indexes into this array. You compare the indexed letters -- if they are the same, you go on. Some obvious enhancements -- only store 128 bytes and mask the high bit of the index -- whatever. Good luck!

Right. As noted in the 2.0 documentation, the release involves only
the programs, not the library. You still use dlibs 1.2 with Sozobon 2.0.

> So, the problem is, I don't have
> a stdlib.h file which I assumed should be part of the system. I have code
> from a book that supports Turbo C, C++, and ANSI C that has stdlib.h
> as an include file, was this file missing from the archive? Could someone
> send me a copy of it, nothing interesting compiles without it.

That's a different problem entirely. The file stdlib.h is part of the
ANSI C standard. You won't find it in dLibs, which was written before
the ANSI standard was finalized and was developed for a non-ANSI compiler
(Alcyon).

Basically stdlib.h provides prototypes (see your C book for a definition)
for all of the functions in the C library. Sozobon C does not understand
prototypes. It does, however, need function declarations -- which inform
the compiler of the type of value *returned* by a function. Those can be
found in the several individual .H files, organized by function type.
For example, string.h for the str* functions, malloc.h for the memory
allocation functions, etc.

In order to port your ANSI code from a book to Classic (K&R) C, you need
to #include the appropriate .H files and slightly alter the ANSI-style
argument declarations in function definitions so that they conform to
the traditional C style. For the latter task, there's a tool called
``unproto'' that was distributed in comp.sources.misc a couple of months
ago. It compiles under Sozobon C with only minor tweaking.

Ah. In dLibs it's stricmp.

#define strcasecmp stricmp

... should do it. The source code is less complex than you suggested:

int stricmp(str1, str2)
register char *str1, *str2;
{
register char c1, c2;

while((c1 = tolower(*str1++)) == (c2 = tolower(*str2++)))
if(c1 == '\0')
return(0);
return(c1 - c2);
}

Message-ID: <kq94DB4w164w@midiline.la.ca.us>
Source record: 46303

is anyone here interested in dreaming and working on dreams of the manufacturing of a new computer system, non-IBM compatible (like the ST was), multi-tasks like the Amiga, and basically knocks other computer systems on their rears? I've got the dream and would like to get started on at least attempting such a project. I may be biting off more than I can chew, but even Edison had to work on his dreams! And what of Ford, and others? I know exactly what i'd like, but getting others to help me with it (I'm not necessarily technical-minded) and doing it myself are the really hard part...

My theory is this... compatibility (as in IBM-compatible) only exists if what you're trying to emulate is BETTER than what you have. But the computer system I'm thinking of wouldn't need to be compatible with anything esle, because it, of itself, would be THE BEST! Think I've got a screw loose? Not in the slightest... and the way I figure, such a computer could easily be made to beat other systems in price as well!

I've rambled on long enough... reply by Email ("MAIL") if interested...

45. Multiple delay timer handler proposal

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-06 07:54:54 UTC
From: sourada@iastate.edu
Message-ID: <sourada.694684494@vincent1.iastate.edu>
Source record: 46291

[This is just a proposal I came up with, I don't know if it really has any value, or if it will work properly. Feel free to tear it apart :-), also feel free to use it.]

Problem:
There are often many processes on the system that need a delay timer, but there is only one free hardware timer. This problem is not confined to multitasking systems; on the ST there are often multiple resident programs that need to do something every so often.
AES provides this service to GEM-conforming programs, and I'm sure any reasonable multitasking system probably has this type of service. But, (as far as I know) nothing like this is provided at a level usable by programs not using AES. (Please tell me if I'm wrong, because I could use this function!)
This problem can be solved by individual programs, but it is somewhat inefficient to solve it in this manner. It would be much more efficient to have some sort of standard for it.

Proposal:
A central 'delay time server' could be constructed to handle delay requests. Since this is to be used at a low level, the setup routine would be called with a trap (possibly xbios?), with the delay value on the stack (longword, just to be safe...), along with the address to be called after the delay. When the server returned, the process could either return to its caller or do something else in the meantime.
The most suitable quantum of time (a balance between small but inefficient, and large but unusable) would probably be the 5 ms provided by the 200 Hz system timer.
This delay time server would take its arguments off the stack, process them (more on this later), and store them in a reserved area, then return to the caller.
(Note: an alternate method would be to have the program requesting the service install its delay information itself in some predefined location, much like the vbl queue. But given the processing I am about to describe, this method would be too cumbersome for every program to do it.)
In order to make the server as efficient as possible (I'm a speed freak), the delay-time table would not simply be stored as given by the caller. Instead, the list of waiting processes would be stored in chronological order, with each delay time stored as an offset from the last (0 included). For example, if the delays necessary were 5, 11, 21, and 8 ticks, snapshots of the list would look like this:

First call: Second call: Third call: Fourth call:
5, addr1 5, addr1 5, addr1 5, addr1
6, addr2 6, addr2 3, addr4
10, addr3 3, addr2

10, addr3

The timer handler portion of the server would be called every timer tick. It would decrement the first delay time on the list, and if it was zero, call the apropriate address given to it by the requesting process. The routine at this address would be expected to be well-behaved, i. e., it would not keep control for a long period of time and halt everything else on the system.
When the timer handler portion recieved control again, it would delete the entry for the latest delay off the list. It would then check to see if the next one on the list was zero and repeat the above. When a non-zero entry was reached (or the end of the list), the handler would finally return to the existing 200 Hz vector address.

Implementation choices:
I have purposely avoided getting too detailed in the description of implementation, since there are many choices that can be made, and I don't want to make choices that others would find unreasonable.
One choice I did make was between two ways for the process to tell the server where to go after the delay. Initially, I thought it would be best for the server to grab the return address from the stack (in the exception frame), and return to this (so the effect to the process would be calling a trap that took <delay time> to execute. This is the approach that some multitasking systems use, but it would not work correctly for a strictly singletasking system, since the server would not know where to pass control after setup. (In a multitasking system, it would simply pass control to another waiting process that had already 'registered' itself with the multitasking 'kernel'. This is also probably the approach AES uses. But, since not all processes on a singletasking system would register with the server, it may end up excluding some processes completely.)
So the server would work better if the process passed the server the address to call after the delay, with the server simply returning control to the process immediately. When the address is called, the routine there would pass control back to the timer handler. In this way, there should be no holes in the control passing.

Another implemenation choice would be how the list is handled. A possibility is some reserved area used to store a linear list, with an addition handled by moving the 'end' pointer higher, and a deletion by moving the 'start' pointer higher, with both pointers wrapping around if necessary.

Other comments:
I know this is nothing new in the computer world, but I think it is at least new to TOS (currently distributed versions).
There are probably better ways to do this, I have examined it fairly well and think the bulk of it is good.
I DISCLAIM ALL RESPONSIBILITY FOR USE OF THIS PROPOSED SYSTEM; ANYONE WHO IMPLEMENTS IT MUST IMPLEMENT IT AT THEIR OWN RISK.

Please comment:
If you are interested in this proposal, please tell me via email. Some comments you might want to make are: "This was implemented ten years ago, why

don't you ever read you developer's docs before posting stupid things like this!", "I would like to see a standard developed for this, please flesh it out, with code and examples", "Looks good, but here's a problem...", etc. If some are interested and there is no previous standard developed for this problem, I will be happy to take comments to make a standard that most are happy with, then flesh it out and actually write code to implement it, etc...

Thanks,
Steven Ourada

47. OCR with scanner (German Syntex or Sherlook or ???) Experience ?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-06 09:02:34 UTC
From: henk@argon.uucp
Message-ID: <1992Jan6.090234.17437@spider.uucp>
Source record: 46294

Does anybody have experience with cheap(?) OCR- programs.

I have a 105 mm hand-scanner with a graphics program Touch-Up.
It can produce .IMG files and a few other formats.
I would like to use it to convert scanned text to ASCII.

I read about Syntex, but its (former) imported pointed to Sherlook.
Is it right that both programs were made by H. Richter.

Finally, if possible, could someone tell me were these programs can be
bought in Holland?

New year greetings and best wishes to you all.

Henk

48. Specification for OMTI 5400 needed

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-06 10:28:09 UTC
From: hschs91om@ap06.rz.tu-harburg.de
Message-ID: <1378@rztsun.rz.tu-harburg.de>
Source record: 46304

I've the problem, that i want to connect an old MFM harddrive with the
OMTI 5400 and an ICD-hostadapter to my ATARI ST. The original ICD-Software
are not regonizing the OMTI 5400, but the software from the book
"Scheibenkleister II" regonize the host as an ADAPTEC 4000/4070 but this
software can't format the harddrive in case of wrong orders to the OMTI,
but the software can read and write an step on the harddrive. Maybe i can patch the
software if i know the parameters for the select, the sense and the format orders
to the OMTI.S

The OMTI 5400 is Rev T with the software Rev. ST.

Using evnt_keybd() from an accessory won't work, because only the "currently active" program gets keypress information from GEM (Don't ask me for a accurate description of "currently active"!)

You do it by intercepting the GEM TRAP vector and waiting for an fsel_input() AES call.

>This is only one
>example. Hotkeys from the desktop should also be possible, but how do

To "hot-key" your program, you need to intercept the IKBD (intelligent keyboard controller) interrupt and look at keypress information as it arrives.

I'm sure that this must be a FAQ but here goes. I just inherited a dead 1040STf and have repaired it to working condition. I would like to be able to connect this to a regular 'ole TV set using one of those Nintendo automatic game/TV switchers. I noticed Radio Shack carries a RF Modulator. Is it possible to use the composite video off the monitor jack?? Does this line carry a signal OR do I need to do something more drastic like buy an additional third party board or something????

Somebody must of done this before. Any clues??

Bob Malay

There is a PD and I believe a commercial graphical version of the Monopoly
game for the ST. I think the PD one might be on atari.archive. If not, I
can try to locate it. The commercial version is licensed, and should be
100% accurate.

Still, I personally think this game is much better with a physical board
(probably because I and 3 other drunkards would probably destroy my machine
during one of our Monopoly marathons).

Teac mechanisms seem to be the ones of choice, at least by Toad Computers. They do not seem to exhibit the media change problem that can occur with other brands of floppy drives. I am not sure of specific model numbers, but you could probably ask Toad (1-800-448-TOAD). I recently posted a file called ibmdrive.lzh to atari.archive.umich.edu which has a bunch of text (and diagrams in .PI3 format) describing how to hook up generic 3.5" and 5.25" drives to the ST, internal and external. Hope this helps.

I can't find any reference in the DevDocs to the maximum number of files that can be opened in GEMDOS. I'm interested to knowing if it is a fixed or configurable limit (similar to MS-DOS's FILES= and BUFFERS= parameters).

I'm interested in this in order to build a POSIX.1 termios layer.

54. ZOO handling of date and time

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-06 21:23:52 UTC
From: ljdickey@watserv1.waterloo.edu
Message-ID: <1992Jan6.212352.19683@watserv1.waterloo.edu>
Source record: 46300

I have been looking at various releases of ZOO and how they handle dates. At the moment I have five different releases, generally increasing in size, and the behavior that interests me falls into two categories. With my two early releases of ZOO I can to this sequence of steps:

```
echo hi > somefile
ls -l somefile
zoo a foo somefile
rm somefile
zoo e foo
ls -l somefile
```

and the file "somefile" will be restored with the same timestamp as the original file. With the later releases, the timestamp on the file moves forward by one hour. This is not acceptable behavior for an archiver, for several reasons, not the least of which is the way MAKE works.

The fact that there are two distinct classes of behaviour and the ZOO programs span several years, leads me to think that somewhere along the way someone tried to do something clever, and botched it. Has anyone else noticed this, and do you have a fix?

55. Re: ZOO handling of date and time

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-07 10:53:35 UTC
From: HAC041@DJUKFA11.BITNET
Message-ID: <92007.105335HAC041@DJUKFA11.BITNET>
Source record: 46305

Recently I had similar problems when MAKEing a program just unpacked from a ZOO archive; the dates were off by a whole day! For comparison I checked this on a Unix machine (Sun 3) and found the same behaviour, so the bug seems to be in the original Unix source code for Zoo.

I wonder if this limit of 32kB is necessary.

I am using lattice C 5.06.02 and I do Malloc more than 1MB with that
function and it does function properly. Ofcourse I first investigated
the amount of possible available memory and then grap everything minus
a few kB. The final program then functions on all kind of ST machines,
from TOS 1.2 until STE with 2.05.

I grap everything in one go to overcome the anxious (but still available
in people's machines) Malloc problem when you did a lot of Mallocs within
one program.

So what's the problem then when Mallocing more than 32kB,
as you have a long int (4 bytes) to pass through the system.

> additional third party board or something????

The 1040STf does not have a signal at the composite video pin on the monitor jack, despite being so listed in the 1040ST owners manual. Composite video is produced by the RF Modulator within the 1040STfm. (The 'm' indicates that an RF Modulator is installed within the machine.)

Suitable video output for the 1040STf requires additional hardware. You might want to search for a used VideoKey from the now-defunct Practical Solutions. I had one hooked up to my 1040STf and found the results 'fair' for games on television. If you want to do 'real work' (i.e. not play games), invest in either a monochrome or color monitor. Incidentally, for about $125 more than the current price of a color monitor, you should be able to pick up a multi-sync monitor, which offers you both mono and color compatability.

>computer could easily be made to beat other systems in price as well!

As I see it, the problem with this is that the large majority
of computer buyers have almost no interest in whether or not their
machine is "the best" in terms of hardware capabilities. I think
most people have two criteria that they maximize:

1. Runs real fast
2. Runs all industry standard software packages

At the moment you're going to have a really hard time satisfying #2
unless you're compatible with another existing platform (i.e., PC, Mac,
or Unix). Remember that most of your potential buyers are close to
computer-illiterate (not because they're not smart, but because they're
not interested), so most benchmarks of computer hardware will be
completely lost on them.

60. UUCP for the ST??? Where is it????

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-07 17:09:46 UTC
From: eldorado@tharr.UUCP
Message-ID: <2963@tharr.UUCP>
Source record: 46323
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I found an old TOS based UUCP package for the ST. It was written by
cshc@tub.uucp (or something like that) and was a 1990 or 1989 alpha test
version. Unfortunately I couldn't get it to work.
Does anyone know of a more recent/working UUCICO package for TOS??
Where can I get it? I don't have ftp access? Maybe mail :-)

I need a TOS based one as my MINIX uucp will not keep up with a v32/v42/v42bis
link, and is costing me money!!!!!!
THanks in advance.

I'm posting the following for someone without net access. Please
reply to the address given...

---Included message begins:

I am interested in replaying sound (MOD Files) files from the Amiga
and various other sound trackers but done not quite understand how exactly
these are replayed or the format of the files. For instance, how do you
play back a sample taken ina c chord as a d chord ? How do I combine two
samples for the left and right channels to a single 8 bit sample. At the
moment I have a board capiable of replaying 8 bit samples independently
on both left and right channels.
Any help would be apprciated, in as much detail as possable as I
would really like to get the board to replay more than just samples. Please
could you keep any replies to a basic level, as I'm not too hot on 68000
assembler and are really looking for the concepts rather than a source listing
Thanks.......Contact me on Janet : DDBAN201F@UK.AC.BIRMINGHAM-POLY.SYSA or
leave a message on the mag. Thanks....

End of included message---

>Any help would be appreciated.

There is a vector somewhere in the system area (from $400 onwards) that is called whenever TOS recognises that there is a new disk in the drive. The routine deals with pulling in the drive's BIOS parameter block (BPB).

The last time I looked at this was when I got a virus -- it used this vector to write itself to the newly instered disk. I can't remember the vector offhand, but mail me if you want me to look it up.

>Thanks.
You cannot get these addresses without using linea. A few weeks ago I had
the same problem. Because I didn't want to use linea I simply included
the 8x8 and 8x16 system font data in my program. Now I am independent of the
font addresses, regardless of the graphics card used.
Both fonts add up to 6 KB of memory, I don't think this is too much today, even
on an ST with 1 MB.

66. Programming considerations

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-07 19:29:26 UTC
From: steve@thelake.mn.org
Message-ID: <A1806506023@thelake.mn.org>
Source record: 46313

Bill Rehbock at Atari Corp. posted a message on GEnie recently that outlined some things to do and not to do if you want your software to be compatible with future (multitasking) versions of TOS and with other GEM applications.

Here's a rundown (paraphrased):

-- Avoid dialog boxes, because they take control of the system and don't allow the user to get at other applications. Instead, use a window.

-- Make all your windows resizable and scrollable, unless there's a solid reason not to (i.e., Pagestream's toolbox).

-- Use wind_update sparingly.

-- For consistency, always have at least Desk-File-Edit entries in your menu bar.

-- Be flexible about monochrome and color. There are 24-bit 1280x960 color systems in the works.

-- Use keyboard equivalents for cut/copy/paste/print: control-x/c/v/p.

That last recommendation has prompted a lot of grousing from users and programmers who believe the ALT key, not the CONTROL key, should be used for such functions. I have not noticed any support for the CONTROL point of view.

The following press release is reproduced verbatim.

Taylor Ridge Books
P.O. Box 78
Manchester, CT 06045
(203) 643-9673

FOR IMMEDIATE RELEASE CONTACT: TAYLOR RIDGE BOOKS
(203) 643-9673

FIRST THERE WAS C-MANSHIP COMPLETE.
NOW THERE'S THE ST ASSEMBLY LANGUAGE WORKSHOP!

Manchester, CT January 6, 1992--Taylor Ridge Books has announced the release of The ST Assembly Language Workshop, Volume 1, a novice's guide to assembly language programming on the Atari ST line of computers. Written by Clayton Walnum, the author of C-manship Complete, The ST Assembly Language Workshop, Volume 1 teaches the basics of assembly language programming, starting with assembly language theory and building up to full-length programs. Covered in the 260-page book are the most-used 68000 assembly instructions, programming style and technique, file handling, printer output, system clocks, color palettes, screen flipping, loading pictures, and more. A complete 68000 instruction reference is also included.

When it's released later this year, Volume 2 of the series will cover GEM programming, with Volume 3 tackling various advanced topics. After studying all three volumes, readers will have developed the skills needed to write virtually any type of program on an ST. Even after reading only volume 1, the novice assembly language programmer will be able to write full-featured TOS programs.

The ST Assembly Language Workshop, Volume 1 comes with a disk containing all sample programs and assorted additional files. It is priced at $24.95, plus $3 shipping and handling and can be ordered at the address or phone number above. Visa and MasterCard are accepted.

68. SLM60804 Laser Controller Box HELP!

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-07 21:11:18 UTC
From: ewels@vax.oxford.ac.uk
Message-ID: <1992Jan7.211118.3663@vax.oxford.ac.uk>
Source record: 46320

Help!

Until this summer I used to own a Mega ST2 with monitor, hard drive and laser printer; however, in July there was a burglary at our flat and most of the stuff was stolen. The one piece of hardware they left was the laser printer (an SLM804), but they _did_ take the laser controller box that the printer and hard disk drive plug in to (SLM60804).

Instead of being fairly simple to replace, the laser controller box has proved impossible - the U.K. Atari warehouse claim that they don't stock them independantly from the laser printers since there's no demand, and I haven't been able to find any shops who can circumvent this. Circuit diagrams or technical details were also unavailable due to copyrights etc., so I am now left with a completely operational laser printer but no way of using it.
I can't afford to buy a whole new laser printer system (which Atari suggested), so any good ideas? Any help with technical details of the box, or somewhere I could get a new one would be much appreciated. Otherwise, if anyone has either a box they wish to sell, or wants to buy my laser printer to go with their box, please drop me a message.

As a result of the burglary I've also got some other spare equipment kicking around that I no longer need (it was at home with the folks rather than in our flat during the burglary), including a graphics tablet, b/w camera system, 3-D glasses with AutoCad, etc.

In case anyone's wondering, I really am a poor student (I bought the whole kit second hand a few years back from a firm I was working for, a few weeks before they folded), and I can't afford to buy a whole new laser printer.

Thanks in advance for any help,

Chris Ewels (EWELS@UK.AC.OX.VAX)

69. Math funtions & GFA-Basic & TOS 2.06

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-07 21:35:07 UTC
From: wscart01@ulkyvx.louisville.edu
Message-ID: <1992Jan7.163507.1@ulkyvx.louisville.edu>
Source record: 46316

...buy the new TOS 2.05 and your buying a new computer...

If I remember correctly that is how someone put it. I could sure use
a change from the old.

My question is, has anyone figured out what's wrong with the math functions?
I use GFA-Basic for just about all my programing need and have this major
problem with the math functions. For example try :

print int(223.07*100)/100 ==> 223.08
or
if .17<>.17 then ==> True

and this is the latest GFA 3.5 version. Just for my couriosity, I also
ran numbers between 0.00 and 100.00 and found that I had about 20 not-equal
numbers in that IF-THEN. It's crazy! HELP!

Is there a new GFA with new math functions (although I belive that the
math errors are incoperated in the computer)?

Will the purchase of TOS 2.06 fix these bugs?

Can anybody out there tell me what libraries I need for a a competent gcc package? From what I can tell, on atari.archive there are mint libraries, gnu libraries and gem libraries.

Also, can anybody point me to a simple file I can test out the compiler on?

thanks, David D'Andrea

71. Midi under Spectre GCR

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-07 22:25:39 UTC
From: hedley@iitinc.uucp
Message-ID: <1992Jan7.222539.13289@iitinc.uucp>
Source record: 46317

Greetings. There are some good mac Midi programs (as well as ST ones)
but suppose I want to run a mac midi one under spectre. I tried one
commercial piece and I found using Mac Nosy the appropriate places
where midi happens but it is/was not easy to patch the routines
to use the simpler ST midi, some of the code tries to init the Zilog
chip (8530 SCC??) this is harmless, the interrupt buffering though
is more of a problem. I gave up after a while but I was able to
use the ST midi from think C, it's just an address in the hardware.
Of course a solution is to get the Appletalk board I read about in the
Spectre newsletter. But then I will need to make a midi interface. Has
anyone else poked around with this stuff or am I the only one who cares
about this?

Cheers, Hedley

There is a known bug in the time zone handling of zoo 2.1. I have heard that it will be fixed in the next release. I do not know when that will be.

To avoid the 1 hour creep that you report, you need to tell zoo your time zone. Set your environment variable TZ to tell the number of hours west of GMT you are. I have my variable set as:
TZ=est5edt

Hope this helps.

GFA has a special operator for comparing equality between floating point
numbers. Instead of = use == . There is no inequality operator but you
can accomplish the same thing with the NOT operator.

For instance:

if NOT(.17==.17) then ==> False

Nope, int_var is 16-bit and is sign extended if converted to a long.
Technically int_var cannot be more than 32k-1: it would be negative then.
Malloc just doesn't eat this :-).

Is there anyone out there that knows of the program (I've heard one or more exist) that allows a North American ST user (60 HZ colour) to run European ST Software (50 HZ colour) without the annoying verticle hold problem?

I heard there is an accessory or something, that will convert the software's 50HZ output to 60HZ so that TVs and things that wont work properly, will.

The TV that I am having this problem on, will not allow me to adjust the Verticle hold knob far enough, as other peoples TVs will, to make up for the rolling.

On an aside: Would anyone know how I might modify the tv to solve this problem?

(It's a 15 year old Sanyo colour tv).

Thanks for any possible help.

In article <A1806506023@thelake.mn.org>, steve@thelake.mn.org (Steve Yelvington) says:

>-- Use keyboard equivalents for cut/copy/paste/print: control-x/c/v/p.
>
>That last recommendation has prompted a lot of grousing from users and
>programmers who believe the ALT key, not the CONTROL key, should be used
>for such functions. I have not noticed any support for the CONTROL
>point of view.

From me you can get any amount of support for CONTROL you want :-)

Before deciding on such matters, one should think about what purpose the Shift/Alt/Control/CapsLock modifiers originally had and/or should have nowadays. For the benefit of users, it would clearly be nice to assign exactly one meaning to each of these modifiers, and conversely use exactly one modifier for each purpose. The meaning of Shift and CapsLock has been clear from the good old days of the typewriter, so there is no need to discuss it. Which leaves us with Control and Alternate for other purposes, of which there are mainly two: specifying commands, and making available more characters. The necessity of having more characters available might not be obvious to Americans (and others), but for many Europeans there is a real need to be able to type in several languages, and all European languages except English use some additional characters. Kludges like ALT-keypad are not acceptable for normal users, and approaches like the 'dead-key' method are applicable only to some, but not all, special characters. And if we look at the foreign-language keyboards Atari has been shipping with STs for years, such as the German keyboard I am now typing on, we notice an obvious solution to this problem: use ALT to enter additional characters.

Therefore my proposal for the use of ALT and Control is the following:
1) Use Control, and only Control, to enter commands.
2) Use ALT, and only ALT, to get an alternate keyboard layout.

This is the only way to achieve a consistent assignment of the modifiers, and it also corresponds to the original meanings of them implied by their names. For European use it is also the only way to remain consistent with the standard keyboard layout implemented in TOS.

Restricting commands to one modifier does lead to one problem however: how to implement more than 26 (or 36, if numbers are

allowed) different keyboard commands, and how to find memorizable names for them? The solution dates back to WordStar and can be found in a modified form in today's Windows applications: Use two keys for each command, of which the first one specifies a menu and the second one an entry in this menu. For 'Open' in the 'File' menu, use ^F^O. In this way, a large number of commands (26x26) are available, which allows to assign a memorizable keyboard shortcut to practically every menu entry even in complex programs and therefore make such programs comfortable even for notorious mouse-haters (which are by no means a small minority).

DDA> Can anybody out there tell me what libraries I need for a a
DDA> competent gcc package? From what I can tell, on atari.archive there
DDA> are mint libraries, gnu libraries and gem libraries.

For a minimum working gcc package you need:

Binaries of the compiler, assembler, linker etc:
gcc-1.40-bin.zoo

Include files:
include.zoo

Library objects:
libolb.zoo

If you want to use the -mshort option (16 bit integers) you also need:
libolb16.zoo

To make life easier, you would want to have the documentation:
gcc-doc-dvi.zoo
gcc-doc-tex.zoo
gcc.brief

And the debugger:
gdb-bin.zoo

And some other utilities (ar, gulam, size, prof, stk):
utilbin.zoo

If you want to use the MINT "operating system" you better have the
associated libraries:
mntinc16.zoo
mntolb16.zoo
(Note the 16 here is the version number, not 16bit)

You don't need the following if you have the libolb:
gemolb.zoo
pmlolb.zoo
because they are already included in the libolb.zoo files.

DDA> Also, can anybody point me to a simple file I can test out

From: zwq017@dmswwu1c.BITNET
Message-ID: <080192.115855ZWQ017@DMSWWU1C.BITNET>
Source record: 46197

As I got no answer on my previous posting about this problem I will ask again:
there exists this VDI-function v_fontinit (VDI 5, Escape 102) to change the
system-font. The only parameter is an address to the structure font_hdr. And
now my question:
How do I get the addresses of the system-fonts? I know that an address to an
array of these addresses is returned in register A1 after a linea0-call. But
one should not use linea any more. Is there any other way?
Another problem: Can I get the font_hdr-structure of the current system-font?

Any help is *very* welcome. Please reply also by eMail.

I hope that the used `tolower' macro (if it is a preprocessor macro)
evaluates its argument only once. Otherwise every second character of
the strings are compared only (and it's possible that the '\0'
character is not found).

-bernd

> the compiler on?
```

In the gnustuff section of atari.archive, in ~ftp/atarignustuff/tos/gnulib, the file "Contents" shows the following contents of libolb.zoo:

```
Archive libolb.zoo:
Length CF Size Now Date Time
-------- --- -------- --------- --------
43326 45% 23648 14 Aug 91 15:29:32 curses.olb
552 35% 358 3 Aug 91 11:38:22 flexlib.olb
62564 67% 21389 5 Sep 91 22:41:28 gem.olb
139158 41% 81167 22 Sep 91 22:43:26 gnu.olb
5942 37% 3752 22 Sep 91 22:43:26 iio.olb
29072 58% 12354 9 Jul 91 11:21:04 pml.olb
74082 46% 40825 12 Sep 91 22:47:12 readline.olb
7860 37% 4915 14 Aug 91 15:29:32 termcap.olb
16658 45% 9187 4 May 91 14:22:10 widget.olb
1732 28% 1250 22 Sep 91 22:43:26 crt0.o
1871 29% 1331 22 Sep 91 22:43:26 gcrt0.o
-------- --- -------- --------- --------
382817 48% 200176 11 files
```

This is what you need for 32 bit ints --- if you want to use 16 bit ints with -mshort then get libolb16.zoo. As indicated, libolb.zoo includes the gem-specific library gem.olb as well as the Portable Math Library (pml) and various others. You will only need the gem library if you are making GEM calls in your code. OTOH, the complete libs don't take up that much extra disk space.

If you want MiNT compatibility, then ~ftp/atari/mint/mntolb16.zoo gives:

```
Archive mntolb16.zoo:
Length CF Size Now Date Time
-------- --- -------- --------- --------
427 43% 242 10 Nov 91 17:23:24+5 crt0.o (V2.1)
40700 60% 16227 16 Nov 91 10:42:30+5 curses.olb (V2.1)
40328 60% 15930 16 Nov 91 10:44:54+5 curses16.olb (V2.1)
530 49% 268 10 Nov 91 17:23:28+5 gcrt0.o (V2.1)
62564 79% 13163 12 Oct 91 17:49:18+5 gem.olb (V2.1)

130946 58% 55366 25 Nov 91 11:33:26+5 gnu16.olb (V2.1)
```

```
5998 54% 2750 22 Nov 91 22:10:18+5 iio.olb (V2.1)
5914 55% 2674 22 Nov 91 22:10:22+5 iio16.olb (V2.1)
29822 73% 7941 10 Apr 91 21:49:40+5 pml.olb (V2.1)
29980 74% 7746 5 Apr 91 22:26:42+5 pml16.olb (V2.1)
5176 53% 2426 16 Nov 91 10:42:56+5 termcap.olb (V2.1)
5194 54% 2415 16 Nov 91 10:44:40+5 termcap1.olb (V2.1)
-------- --- -------- --------- --------
553751 65% 196291 14 files
------------
```

As for C source, why not pick one of the GCC source files and exercise your compiler on that, you could try ~ftp/atari/gnustuff/tos/patch/patch.zoo which contains C source code.

82. Problems with floppy port

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-08 18:09:00 UTC
From: bchs1k@menudo.uh.edu
Message-ID: <1992Jan8.180900.13147@menudo.uh.edu>
Source record: 46329

My 1 Meg 520 ST is having problems with the floppy port.
The drive works, and the power supplies (computer + drive)
work. However, when the machine is powered up, it hangs (with
the green light on the computer on, indicating power is going to
the machine), not booting from the attached floppy. Any ideas?

Thanks much,

<ESC>

In this case it's a function call -- and, anyway, the ctype.h macro for
_tolower in Sozobon 1.33i evaluates its argument only once, so there's no
problem there, either.

But it's a good point to remember that function calls and macros aren't
freely interchangeable. The preprocessor can surprise you.

From: willing@pantheon.icsl.ucla.edu
Message-ID: <5507@lee.SEAS.UCLA.EDU>
Source record: 46331

Has anyone else out there been experiencing problems with Eric Smith's port of tcsh? I am running it over MiNT 0.92 with TOS 1.2. The problems that I have seen are:
1) An apparent memory leak--after a while the memory of the ST is filled and no programs will run (even from the desktop). I don't know how it is mallocing outside its heap. Note: I am not using the alias "precmd".
2) Some conflict with GEM programs. It will not run from within bgacc and is also flaky running from the desktop. If started right after booting, it runs fine (until out of memory). After exiting, It bombs with segmentation or bus errors if I try to run it again. It also doesn't like to run after any GEM programs have been invoked on the desktop, including accessories.

???

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

If you peek in comp.binaries.atari.st, you'll see that Ian Lepore's
``Heat and Serve'' version of Sozobon C is beginning to move across
the network.

This version is especially good for beginners and anyone interested
in running the compiler directly from the GEM Desktop.

It's been tested fairly extensively on STs, but not at all on TTs.

We received one vague report of a problem with INSTALL.PRG, the
automatic installation/configuration program, from a TT user who
is a GEnie sysop. If any TT users could elaborate on this, please send
a note to me and/or Mike Dorman <MDORMAN1@UA1VM.UA.EDU> so it can
be forwarded to Lepore.

The composite video on the old ST's connector is not connected unless
you have an STfm with an RF modulator, and yes this is a FAQ. :-}
I don't think the Radio Shack modulator will do you any good either
because I believe it takes composite video in (and audio in) and
produces modulated RF. Personally I would look for a used RGB monitor
somewhere, fiddling around with a TV is kind of a waste of time,
especially through RF. You would only get a very fuzzy low res, with
bleeding colours etc.

> their box, please drop me a message.

I suggest you should call/fax/email to Atari Europe or Atari USA and
don't hesitate to demand to speak with the persons superior, even if
you have to go all the way up to the chairman of the board.
Atari MUST be unbeleavable dork corporation IF you can't get any help
this way. I wish they realize this too.
If you can't find tel/fax numbers or email-addresses don't hesitate to
ask, at least I try to help you with them. But anyone who
knows/remembers them, PLEASE POST!

If even this turns to be a dead end, I am ready to take a risk against
the copyright laws and make a full circuit lay-out for you. It is easy,
I have such controller inside my tower... and maybe it wakes Atari
Corp. up a bit... They do nice machines and sell them with nice
prices, but their company policy and user support sometimes really
sucks!

Hi all,
I am looking to buy a 1040 st or a mega st, and need to know some things:

{1} would I be able to use the diskdrive, monitor, mouse, and printer
from my old 520st (I don't know model #s, but they are from the first
year or two of the 520's existence)

{2} Will the software run from my old 520 st
on the 1040 st's or mega's

{3} Is there a difference between the different lines (1040STFM and 1040STe and
whatever else there is...)

{4} Please also include anything that you think may help me in my decision.
(I will be using the computer to play/write video games...
Dungeon master type stuff...
- and - writing some C++ application programs.)

Thank you in advance...
Mike Meehan meehan@en.ecn.purdue.edu

It's a nice dream to combine the good parts of different operating
systems. But any OS need software, and you need lots of developers
working real hard to make applications that can compete with existing
ones (so-called 'industry standard' or any other bloody standard).
BTW: Do you mainly plan to design new hardware, or a better OS?
I think there's enough good hardware available, but few really good OS.
And there's Unix, of course, which is surley going to be the next standard
OS for very different konds of hardware platforms. The problem of Unix
is the lack of cheap and powerful standard applications, like available
for DOS, TOS, Mac, Amiga and so forth.

Two small companies currently develop a similar project. A new standard
shall be born, for different hardware platforms and different OS, combining
the best of several worlds. This architecture will be called 'PowerOpen',
and the two companies are IBM and Apple, technically supported by
Motorola and Intel. Do you think _you_ have the chance to compete?

Sorry for sarkasm, but I think the age of 'inventing an Apple' like
Steven Jobs once did has passed away.

Thank you!

I hope that whoever has the source will re-compile ZOO now and then
make available.

|screen; the second one just appears over the top of the first. I thought
|the last form_dial was meant to send re-draw messages to Flash so it can
|re-draw its screen?

That's correct, form_dial(FMD_FINISH,...) will cause redraw messages to be sent to windows intersecting with the form_dial rectangle. The problem is that unless given "enough" time to redraw, some windows might not replace the old form and some may only partially get to redraw.

A delay to crank the GEM event queue after your DA closes its first dialog might help, but who knows how long it'll take for Flash to do its thing? Consider opening up windows behind your dialog boxes, or even putting your DA's dialog boxes inside windows. That way, in the process of opening and closing windows, you'll give Flash more of a chance to redraw. Also, if the code that's going on behind your second ("Please Wait...") dialog makes an occasional AES call, Flash will get a chance to redraw its window behind your DA's window/dialog.

wscart01@ulkyvx.louisville.edu writes:

|My question is, has anyone figured out what's wrong with the math functions?

```
| print int(223.07*100)/100 ==> 223.08
| if .17<>.17 then ==> True
```

What you've discovered isn't a problem with GFA Basic, rather it's an inherent limitation of doing floating point math with computers. There is always a limited amount of precision available for floating point operations. Generally, it's a tradeoff between precision and speed. The more precision you want, the slower the math routines.

In the case of the first equation, there isn't a whole lot you can do if GFA's floating math routines don't use extended precision intermediate results. The 223.07 * 100 is getting whacked off at however many digits GFA Basic likes to keep, so when the divide by 100 happens, you get a less accurate answer than you'd like.

In the second case, though, you've fallen victim to a common programming error with floating point numbers. Integers can be compared for equality without much problem, since precision doesn't enter the picture. With limited precision floating point numbers, though, .17 minus .17 may not equal 0 (probably the way the <> operator works). To get around this, choose a very small value and do the comparison yourself:

```
if .17 - .17 < 0.0001 then
```

For all practical purposes, if the difference between the numbers is very small, you can consider them equal. GFA probably didn't want to choose that "very small difference" for you, because it may change based on the precision you need for a particular program.

Well, the big problem with this is that programs which _must_ use the control key such as terminal emulators will be forced to be inconsistent. Keys like control-C, control-S and control-Q to name a few have very well-defined functions on many computer systems including IBM PCs.

If we use the _only_ the control key for commands, how can a terminal emulator provide a short-cut for Cut form the edit menu (traditionally C) and still allow the user to break out of a program. This will lead to different keys for cut and poaste in different applications whcih is the thing we are ultimately trying to avoid. So what about other characters? They can't be used in most terminal programs which are limited to ASCII so overloading the control key between these two mutually-exclusive features doesn't seem bad.

Macintoshes have solved the problem by providing control, command, and option keys.

>Well, the big problem with this is that programs which _must_ use the control
>key such as terminal emulators will be forced to be inconsistent. Keys

That's true, but terminal emulators are the only applications I can think of that have such a problem. So the choice seems to be either to make terminal emulators inconsistent or all other applications. In that situation I would rather place the burden on terminal emulators, for a number of reasons:
1) It's just one type of inconsistent application
2) People who use terminal emulators are actually doing their work on a different machine, which means they are not using anything resembling a GEM interface. Hence they have to change habits anyway, so an additional change on the ST side wouldn't disturb as much.
3) People who use terminal emulators are normally not beginners and tend to know what they are doing.

>allow the user to break out of a program. This will lead to different keys
>for cut and poaste in different applications whcih is the thing we are
>ultimately trying to avoid. So what about other characters? They can't be

True, but it's not the only type of inconsistency that should be avoided.

>used in most terminal programs which are limited to ASCII so overloading the
>control key between these two mutually-exclusive features doesn't seem bad.

We seem to agree that some kind of overloading is unavoidable, but in my opinion it should be the ALT key that gets a double meaning. The connection between the Control key and entering commands goes back to ASCII terminals and is one of the oldest traditions among computer users. It is even apparent from the name 'control' (try to convince a novice that he should use ALT to control his program and control to enter characters). And even in the case of terminal emulators, pressing Control leads to some kind of action, even if on the remote machine.
Using ALT for entering commands leads to an extremely annoying inconsistency for all users of non-English keyboards. How would you explain to a German beginner that ALT-A performs a command whereas ALT-A(Umlaut) produces a square bracket?

>Macintoshes have solved the problem by providing control, command, and option
>keys.

Just as IBM compatibles nowadays have Control, Alt and AltGr. Of course a third modifier key would be the best solution, but we don't have a spare

one...

98. Information about future TOS versions

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-09 11:03:29 UTC
From: ONM07@DMSWWU1A.BITNET
Message-ID: <92008.112424ONM07@DMSWWU1A.BITNET>
Source record: 46194

Just found this text on our local FTP server:

--- snip ---

The following files are pre-release versions of the
Win32(tm) Application Programing Interface. Microsoft
is providing these files in pre-release form to give
Windows developers a chance to review and understand
the changes between the Windows 3.x API and the Win32
API. These files may be redistributed without fee
in unmodified form subject to the copyright statement,
which is the first topic in the help overview.

The help files are provided in two forms: API32WH.HLP
for use with WinHelp, and API32QH.HLP for use with
QuickHelp and the Programmer's Workbench. Because these
files are over 2MB each, they are available here
in pieces, API32WH.001 through .004 and API32QH.001
through .004. Download the files in pieces, and also
download COMBINE.BAT which will combine the pieces to
recreate the original file.

If you are not a Windows 3.1 beta site and you wish to use
the api32wh.hlp file, you will need to download the
wh307c.zip file, and unpack it to re-create a version
of winhelp.exe which will read it. The beta Windows 3.1
WinHelp.exe programs should also read api32wh.hlp, and
the wh307c.zip version should read Windows 3.0 help files.

--- snip ---

Now my question: if even Microsoft can do this, why can't Atari give us
SOME information about Multi-TOS?????

You should be aware that is one of TOS's major amusements to
throw you out of this vector again.
(after each TOS/TTP start, IMHO)

One solution to this is to intercept BIOS Setexc() too and watch
for trap#2 being changed.

From: keithb@hemel.bull.co.uk
Message-ID: <1992Jan9.123426.29863@hemel.bull.co.uk>
Source record: 46199

Has anyone experience of using ZEST (NEXT-like windows in GFA Basic)?

A screen-designer (AutoZest) generates GFA code to create and manipulate
Windows, buttons etc. It looks very impressive but runs in mono and
generates GFA 3 code to run in mono.

I prefer colour and have GFA 2. I can convert the generated code easily
(except for a BOUNDARY 0 statement - does this set the border colour?)
but wonder if a colour version of AutoZest is available?

102. Bug in MiNT 0.92 ?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-09 13:28:59 UTC
From: roarment@faui09.informatik.uni-erlangen.de
Message-ID: <1992Jan9.132859.17090@informatik.uni-erlangen.de>
Source record: 46200

Hi there,

I noticed some strange behaviour using MiNT 0.92, and was wondering
if the bug is inside MiNT or if it just has to do with my hard disk
driver:

If I do a 'File-Show Info' from the Desktop of drive 'C:', I get a
'TOS Error #34'. I first suspected my hard drive data beeing corrupted,
but rebooting my machine without MiNT and trying the same again under
plain TOS 1.4 (all accessories and auto folder programs disabled)
resulted in the normal info box with the correct data.

I suspected some bug in MiNT's Dfree(), but a small C-program showed
that Dfree() was working perfectly fine.

Increasing the debugging level of MiNT (hitting CTRL-ALT-F1 two times)
showed me that the Desktop recursivly traverses all directories using
Fsfirst/Fsnext to collect the information. Shortly before terminating
with the TOS error, the MiNT kernel issued a warnig: 'having to re-use
a directory slot'.

So can some guru out there tell me if the bug is inside MiNT, or if
my hard disk driver does something illegal ?

I'm using a 520 STM with 1 Meg memory, a 20 MB ProFile 20 SCSI hard
drive from Protar, running the Protar HD driver Version 2.11, Jul 1990
under TOS 1.4.

Any hints welcome,

Bye
Roberto

A medium-res version of the ZeST code was released on GEnie sometime in December, along with a compiled application program which used the interface. I don't know whether it is compatible with GFA BASIC 2.0 or not.

If you're patient, I'll try to gt it to the atari.archive server by the end of this week. I you're impatient, and have a GEnie account, go look for the relevant files there.

>up all the machines and the ring goes down when the first machine crashes.
What collision protocol ?? With standard cables, you connect the output

from one machine to the input of the next, (although that means all the nodes have to have the 'midi-demon' running all the time), then pass packets around the ring. I.e. each machine reads in a packet, and forwards it on to the next machine unless it is the intended receiver. A machine can insert a packet any time it wants. What kind of protocol you build on top of this is upto you.
This does work, I used it in a multi-user adventure game (the software supports 60+ players, but the biggest ring I've tried is about 6 machines).
Of course its a good idea to put the address at the start of the packet so that it can be forwarded on, mid packet and not at the end (saves bandwidth).
>If you use Midi-Thru, you have the problem of inserting your own packets
>into the data stream and you'll have to do lots of buffer management. Midi
>is too slow for sending out a short query packet before a transfer -- if
>you do this on a 5-site-ring, it'll surely take at least 100 ms ... just to
>decide whether a new net command may be issued or not.
What decision, you seem to be suggesting that the network has all the bad points of a shared bus type net, and all the bad points of a point to point chain, and none of the good points of either.
Midi will be slow agreed, but depending on the required use, it may be workable. Plus in the system outlined above, (point to point etc) there can be several packet on the ring at once, which increases the amount of data that can be shunted around in a given time.

>Daniel
>
>P.S.: Yes ... I know ... it's a little negative-vision, but all the Midi-
>based networks were so slow that you couldn't reasonably work with them.
>Just imagine ... a newwork at 25 % of the speed of your floppy drive :-/
I agree that its pretty bad, but is does depend on what its needed for, it is possible.

>
>Thanks, Rob.

A termcap entry will not help you. The problem is that MiNT does not simulate
a terminal for console input. All function/arrow keys return an ascii value
of 0 when read by standard UNIX-like i/o. To determine which key is pressed,
a program must use TOS i/o and look at the key's scan code. This maintains
compatability with TOS/GEM programs. Maybe under certain domains, the MiNT
kernel could simulate VT100 keycodes, but this would require someone to
modify the kernel.

108. Replacing LS logic parts between MMU and DRAM

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-09 23:47:39 UTC
From: jmack@b11.ingr.com
Message-ID: <1992Jan9.234739.17206@b11.ingr.com>
Source record: 46207

I had heard on the net once of someone replacing the LS logic parts (74LS244 and 74LS373) with F speed parts. Could someone please tell me why this was done and/or what problem it fixed?
The reason I ask is that I just finished a 520ST to 2.5Meg upgrade via the piggyback method (my second upgrade performed; so I know it works) and the lower bank (512k) is heat sensitive. When the machine is cold, the lower bank shows up in the MMU as being 128k, the upper 2Meg bank is OK. After the machine warms up and I reboot, I get 512k and 2Meg like I expect. At this point I can use freeze spray and lose part of the lower bank again. Since my new DRAMs are 120ns and the old ones are 150's, plus the heat sensitivity, it sounds like a timing problem. What then, is the deal with those LS parts? Thanks in advance!

I run Uniterm on a 1040 and Mega ST2 and have never had this problem.
But I wonder if you are using (perhaps inadvertently) file capture mode.

>program (excuse the cockup at the end of the line)

No, no, no ... that's not true. When the redraw event is sent by the acc it
is received by the "background" application which is responsible for redraw-
ing its own windows... now, I don't use Flash & don't know if it interprets
(sp?) redraw-events properly. But certainly redraw-events sent by accs
ARE NOT suspended until the accs finish.
On a related note, the function that sends a redraw-event for the area
covered by a dialog-box is: form_dial(FMD_FINISH,...);

If you send the redraw-event manually (i.e. with appl_send()) you should
make sure you are using the correct dimensions for the clipping rectangle

I'm glad you posted this summary here (I read the original via Znet),
but this extract implies that all dialog boxes are to be avoided. What
was really meant is that the main application should be set up to run
in a window, not as a dialog box. A couple programs that "break" this
rule that spring to mind are ArcShell, and most of the DC utilities
(Squish, Xtract, etc.)

> -- Make all your windows resizable and scrollable, unless there's a solid
> reason not to (i.e., Pagestream's toolbox).

Unfortunately, this isn't always possible, due to the screen space
eaten up by all the window gadgetry, if you want your application to
be able to fit on a medium-res color screen. This is made worse by
the GEM bug that forces empty scroll bar areas on you whenever you
include the SIZER box. In my opinion, this is a bug that Atari should
finally fix, if they expect developers to follow these rules.

I appreciate Bill outlining the do's and don't's, but think that a bit
more explanation of the motivation for some of these would help people
to understand and encourage them to comply.

115. PC Ditto II and Mega ST. HELP!!

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-10 07:33:03 UTC
From: i9853100@uavax0.ccit.arizona.edu
Message-ID: <1992Jan10.003303.1@uavax0.ccit.arizona.edu>
Source record: 46214
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a PC Ditto II doard that works fine on My 1040 ST, but does not
work properly on my Mega ST. I am sure that it was connected properly to the
Mega. It would boot DOS and then would always crash very shortly thereafter.
Later, I noticed that If I try to turn on the Blitter from the desktop (
before even running the PC ditto software) the computer instantly hangs.
If I disconnect the PC Ditto, things are normal.
Does anybody have any ideas as to what the problem is? Was the PC Ditto II
known to have problems with the Megas? I am not sure if the board has the
updated PALs or not. Does anybody know the part numbers of the replacements>
Any help would be appreciated!

Doug Tarico

>Thanks, Rob.

I don't believe the port od tcsh supports the Atari special keys, ie the
cursor group and the function keys. These keys needs special code to
determine what they are, else they all look as if they return NUL (`\0`).

From: neil@cs.hw.ac.uk
Message-ID: <4445@brahma.cs.hw.ac.uk>
Source record: 46221

If you have an STE, you will no doubt have noticed the two new 15 pin ports on the left hand side of your machine. These are for extra switch type joysticks, light pens and paddles. I've been trying to use the paddle ports with no luck. Has anyone put a potentiometer on these ports and got results? For simplicity sake lets just say I'm trying to read PADDLE #0 X position at $FF9210 (the data is actually a byte @ $FF9211).

My instincts (OK my old BBC Micro experience) told me to wire the port thus:-

```
10K Linear
Gnd -----\/\/\/\/\/----- Vcc
^
!
PADDLE INPUT
```

I am annoyed that the developer kit says next to nothing about such constructions. All it tells you is the pinout and where to read the data.

BTW I already know that the pinout diagram in the dev docs is wrong in that the PADDLE X and Y pins are transposed.

Any help greatly appreciated.

hmm... i have quite successfully used non-modal dialog boxes
in the past. i was programming in NeWS as the time. There seems to be
a fixed notion in some peoples minds that dialog boxes are always
modal. its a lot more convenient to dismiss a dialog box as opposed to
a window, and more consistent use of the visual metaphors of dialog
boxes as opposed to windows, IHMO ofcourse ...

> -- Use wind_update sparingly.
if a decent window manager is available, there should be
absolutely no need for this.

This is a real problem, since the whole network crashes if one single
machine goes down. Not acceptable for any real installation. If you want
to go around this, you have to set up some hardware that bypasses a machine
when it's turned off or not responding.

> then pass packets around
>the ring. I.e. each machine reads in a packet, and forwards it on to the next
>machine unless it is the intended receiver. A machine can insert a packet any
>time it wants. What kind of protocol you build on top of this is upto you.
>This does work, I used it in a multi-user adventure game (the software supports
>60+ players, but the biggest ring I've tried is about 6 machines).

It's ok for games, since everyone *wants* his machine to be alive, but in
a real network where different people run different applications (or trying
their new site-killers...) the ring will be broken most of the time, I think.

>Midi will be slow agreed, but depending on the required use, it may be
>workable.

The standard network service, remote file transfer (by mounting other people's
block devices?) will be much too slow on this transport medium.

Still with a negative-vision of it... :-)

> (Squish, Xtract, etc.)

It's a little broader than that. Even with a program that uses a menu bar
and windows, it's easy and tempting to hog the screen with a status box
while performing some lengthy task. (Rehbock offered file transfers and
printing as examples.)

A dialog doesn't block GEM's pseudomultitasking, but it blocks the user
from having access to the menu bar or other objects, such as desk
accessories that already have been opened. Rehbock's posting suggests to
me that the same will be true of the revised user interface in
multitasking TOS.

Somewhere around here I have a chunk of code from an unfinished email
program that probably would serve as another example. I prompted the user
for an email address and subject line by using a dialog box and form_edit.
I can imagine a situation in which I might start to type a list of
addresses, then need to root around in a file to find another address.

With a dialog box on the screen, I can't activate another window or
another application (desk accessory) to perform that task. If I had coded
my user interaction to take place in a window, I could switch
applications, find the information, and switch back.

Hello all ST users,

I would like to buy a Harddisk, something around 80-100Mb.

I have heard though that you HAVE to partition the disk into a number
of drives. eg. c: d: e:, etc. and that they have to be within a certain
size.

What is this size and can it be "fixed" to increase it?

Either post here or email me please.

Thankyou

Jake

Ina a previous post for this topic, the following appears:

In article <kq94DB4w164w@midiline.la.ca.us> jared@midiline.la.ca.us ('286 Highla
>My theory is this... compatibility (as in IBM-compatible) only exists if
>what you're trying to emulate is BETTER than what you have. But the
>computer system I'm thinking of wouldn't need to be compatible with
>anything esle, because it, of itself, would be THE BEST! Think I've got
>a screw loose? Not in the slightest... and the way I figure, such a
>computer could easily be made to beat other systems in price as well!

As I see it, the problem with this is that the large majority
of computer buyers have almost no interest in whether or not their
---------- Bunch 'o' stuff deleted ------------------------------
1. Runs real fast
2. Runs all industry standard software packages

At the moment you're going to have a really hard time satisfying #2
unless you're compatible with another existing platform (i.e., PC, Mac,
or Unix). Remember that most of your potential buyers are close to
computer-illiterate (not because they're not smart, but because they're
not interested), so most benchmarks of computer hardware will be
completely lost on them.

Dave Baggett

Dave is SO right! There are a LOT of problems with this dream, at least from
the commercial standpoint. First off, define "SIMPLY THE BEST" in a commerical
frame. If you don't include "Does all the things I want it to do, so fast it
saves me a bunch of time, for the kind of money I've got to spend and without
having to read any books or owner's manuals," then you've missed the point.
I could make a pretty good argument that the ST was "the best" home
computer when it came out, but only from the standpoint of price/hardware
performance. By the same token, the Mac had to have been one of the worst!

However,
Dreams are great things, and should never be forgotten or dismissed! If you
are willing to forego making any money on this computer design for quite a
while, and work your b*** off keeping it ahead of other technology, you might
succeed! Think along the lines of shareware-hardware! Give or loan the thing
away with all the software for a while, who knows, you could be the next Steve
Wozniak!

Bill (I know he's here, coz I kin smell 'im) Chase

> Another problem: Can I get the font_hdr-structure of the current system-font?

You should avoid LineA but if you _really_ like to get the address - call
LineA "init". It's the only way.

127. Modem Setup in GFA BASIC

<ONM07@DMSWWU1A.BITNET> writes:

|CTRL-C/V/X etc. is used by practically ALL modern GEM programs
|(SciGraph, Interface, Phoenix, Script....)

...PageOMat...

I also agree that the only programs that have a real problem with Control-ized key equivalents are terminal programs. Several solutions exist for terminal programs, too. Make them more modal, so that menu key equivalents are not available during terminal input (not the best, but _a_ solution). Let the user configure key equivalents for problem keystrokes. Provide other means of generating common control keystrokes or of performing standard File & Edit operations. White Knight on the Mac, for example, has the option of using buttons to start and stop text and to send ^C.

This issue concerns me a lot because 2 of the programs I use more than any other, STalker and STeno, would probably end up with different key equivalents for common menu items. On the other hand, the "Edit" menu items in STalker are so rarely used, I wouldn't miss the control key menu equivalents.

>size.
The maximum partition size is 256 MBye, if you partition your drive with
a program compatible to at least HDX 3.0.

>What is this size and can it be "fixed" to increase it?
Once you have partitioned your drive you cannot change the partitions sizes
without loosing your data.

ENCHANCEMENTS - mask off the top bit???
What about us who use national a char. set??? Your Idea with the table is very good, because it also works with national chars. If you look at the character set, then you will notice that there is no symetry in UPPER/lower chars of the national chars, and therefor is your tabel based implementation good (and the only working implementation!)

>-- Be flexible about monochrome and color. There are 24-bit 1280x960
>color systems in the works.

When I first heard about a 24 bit VDI, I looked at the VDI and came to the conclution that it couldn't be done. Please can someone tell how to make ones programs 24 bit clean?

The problems is
- colour index parameter (only 16 bits),
- the ncolors (in the workout array) which is 16 bits too (whith zero meaning 'true color').

The following is speculation in how it could be done (so people have something to flame - they just love it!):
A TCVDI (true colour) could be implemented by making use of the VDI-palette (which can be up to 30 bits - 10 bits per colour), to set up a selection of colours. The 'color index' parameter will then be a shortcut for a 24 bit colour.
This will mean that pixels allready on the screen wont change colour even if the palette entry for that colour is changed (on a TC-card).

>-- Use keyboard equivalents for cut/copy/paste/print: control-x/c/v/p.

>That last recommendation has prompted a lot of grousing from users and
>programmers who believe the ALT key, not the CONTROL key, should be used
>for such functions. I have not noticed any support for the CONTROL
>point of view.

All the programs I use, use the CONTROL key! Besides - the ALT key is used by TOS to give me NON national chars! I have to press ALT to get '{}[]~@' plus paragraph and dot-dot (name?).
Why change this parting (word?), esp. now when Atari have assigned the ALT-keypad combination to get to all ascii chars?

I think that is would be very confusing if we used the ALT key for Control of the program and the Control key to get alternate chars!

I use both German and US/UK programs and it is can be very confusing! If a german program have a shortcut with 'Z', then most programs expect you to press the 'Y' key, because germans have these keys exchanged. This could be avoided if people didn't use the SCANCODE directly, but used the BIOS-translation tables to get a ASCII value.

Some US/UK programs programs have shortcuts outside the base keys (fx '^[')
I have to press ALT to get to the key and the program expects to see the

control key alone...
Or '+' and '-' are next to the '0' key on amercian keyboards but not that on other keyboards!

Could we get a French guy to show the first keys on their keyboard?
Is it 'AZER..(?)' instead of 'QWERTY'? - boy they must have a nightmare when using 'imported' programs...

Therefor : shortcuts with CONTROL and only on the base keys (a-z) using the BIOS-translation tables. Or on fixed keys (function, keypad, help, undo....) with the SCANCODES directly!

-Klaus

--

Ask me how my university is censoring my Usenet access!
sourada@iastate.edu

I've build the GCC cross-compiling environment on three platforms
without problems (a 68020 box with SVR3, a Mips box with SVR4 and a
SNI Targon /35 (aka Pyramid)). The only major changes were necessary
for the Pyramid, which aligns strutures on long words (only the
linker, the archiver and the symbol lister needed the fixes). The
fixes for this are in the latest utilities (>PL20). Bammi did the
the changes for word aligned machines like SPARC and I extended them
to also work on long word aligned machines.

Your particular problems seems to in connection with the byte
ordering. All machines I used, use big endian notation. The
DECstation is the only machine I know off, which operates the Mips
processor in little endian mode. (The R3000 can run in little and big
endian mode). So, you have to do some patching to make the linker
work on a little endian machine.

> year or two of the 520's existence)

Yes you can use your existing disk drive you merely plug it in the rear a
and it becomes drive b:

>
> {2} Will the software run from my old 520 st
> on the 1040 st's or mega's

It will depend on what software you have as some of the OLDer games will not
run 100% on tos 1.4 and above but all else works 100%. (You can use
quick.tos to load the older versions of tos to play the games though)

>
> {3} Is there a difference between the different lines (1040STFM and 1040STe a
> whatever else there is...)

There sure is .. but no matter what you get I am sure you will be happy. If
you have the oppitunity I would suggeST you look at the STe as they can be
easily expanded up to 4megs of memory with off the shelf SIMMS.

138. New World RAM upgrade problems

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-11 23:10:47 UTC
From: onstott@d.cs.okstate.edu
Message-ID: <1992Jan11.231047.6548@d.cs.okstate.edu>
Source record: 46235

I have an Atari 1040St in which I recently installed a New WOrld
RAM upgrade kit. Now, I have some interesting problems. First, I have
double checked and triple checked the installation and traces everything
is to SPEC and there are no cuts. So here is the problem:

1.) Some programs (Word Perfect, Interlink, etc) put garbage on the screen
when they run. However, interestingly enough, the garbage is predicatble!
Yes, everytime these programs run the same type of garbage is located in the
same place. In Word Perfect, for example, I only get garbage when I use
a dialog box.

2.) I upgraded to 4 Megabytes of RAM because I use Steinberg/Jones
Cubase for the Atari ST. A program called Switcher is included with
Cubase. Switcher, for those who don't know, is a quasi-Multi-Tasking
operating system. I can load up to 10 programs (provided I have enough
memory) and they will more or less run concurrently. Although I have
found conflicts between the RS-232 port and MIDI. Anyway, to make the
plot even more interesting when Switcher is running I GET NO GARBAGE AT
ALL. For instance, if I load Word Perfect from Switcher I have no problems.
But if I run it from the TOS desktop, Voila, lots of probs.

I have a theory and I wanted suggestions. Is it possible that I have
an old version the MMU that has no idea what to do with the extra RAM
so it goofs up. While Switcher, being the clever genius it is, happens
to know what all of the extra memory is for, can patch up mistakes the
MMU makes? I don't know. The ST I am using is a STFM and it is about
5 years old. Any help would be greatly appreciated. At the moment I think
I am going to chunk it in favor of an STE; BUT, the money out of it would
be nice.

Thanks again.

You're right, of course. But you also don't need both vertical and
horizontal empty scroll bars, either. One would suffice.

Incidentally, the Amiga does that sort of thing - the sizer doohickey
sorts of takes up a notch in one corner, making the window work area
non-rectangular.

Yea, great. First provide a "feature" as an essential part of the
Atari interface and then 5 years later ask not to use it. It is
Atari's fault not to provide support for modeless dialog boxes.

Use a window? but there are only eight windows to play with!

If its the C0 100109-001 MMU than you can get problems with 2.5 megs.

But I have seen othere problems with 520's upgraded to 1 meg, with
bits flikering/givering on the screen with some programs,
I also did test the Memory with a good memory tester program and did
not find any faults, also I never had chance to find out what was finaly
wrong. !

May be Atari put all there stuffed chips in the 520 ST's..

From: tjh2982@ultb.rit.edu
Message-ID: <1992Jan12.181836.9677@ultb.isc.rit.edu>
Source record: 46144

Good morning everyone. I have a question about my system....
I'm running a 1040STf with TOS 1.0 and GEMDOS .19 (old!) and a 30MB
Megafile Hard Drive. I have the HD set up as a single partition, and
everything seems to work fine (sort of)... I have folderXXX.prg and a
a program called headst11.prg in my autofolder (I use headstart to run a
shell, okami13b, because i dont like gem :-)) anyway, when the shell
crashes which it does occasionally, i have noticed that sometimes
programs on the harddrive get trashed, meaning they don't work anymore.
I was wondering if anyone knows if this is a problem with the drive, or
more likely the fault of the shell I am using. Anyway, thanks for any
help!
L8r,
Tad

143. Patch to compile.el for ST GNU Emacs users

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-12 20:12:58 UTC
From: ridderbusch.kd@sni-usa.com
Message-ID: <RIDDERBUSCH.KD.92Jan12201258@usun01.sni.de>
Source record: 46183

```
This are some diffs, which might be interesting for ST users, who use
GNU Emacs and GNU-C on their ST's. Apply the below patches to
compile.el from the GNU-Emacs distribution. This allows the function
next-error (bound the \C-x`) to work, also with native TOS style
filenames. You might then want to rename the resulting file and
restore the original. I've renamed it to compiles.el. To use the patch
include the line below into your Emacs initialization file.

(autoload 'next-error "compiles" nil t)

Now, to actually use this patch, compile all your source files with
the additional '-z' option. This option directs the compiler driver
gcc.ttp to redirect the output for all subsequently executed commands
to a file named "compile.err". Now startup Emacs, type ^X` (CTL-x`)
and by this circle through all error messages.

This also works for the output of the grep command. Execute

grep -n 'things to serach' files_to_search >grep.out

And again by typing ^X`, you can step through all found occurences of
a search.

The next-error function looks for the two file "compile.err" or
"grep.out".

BTW, the parsing of the error messages may take a little bit of time
on a normal 8MHz ST.

Actually, that's pretty close. My (limited, thirdhand) understanding is
that the 24-bit color VDIs work with a 256-color TT palette. You set up the
palette, draw with it, then change the palette entries without affecting
what's already been drawn.

> This will mean that pixels allready on the screen wont change colour even if

145. 7 window AES limit...

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-13 05:06:03 UTC
From: sourada@iastate.edu
Message-ID: <sourada.695279163@vincent1.iastate.edu>
Source record: 46146

Anyone know why the AES ever had a seven window limit? I'm sure there is some explanation relating to how window data is handled internally, but that doesn't make it clear why DRI (I assume) would ever have made the decision to support such a small number of windows.

Are there any versions of TOS (Atari's or other's) that allow more than 7? Hopefully at least Multi-TOS will have a few more, I can't imagine trying to run more than two programs with only 7 windows around...

Later,

146. Re: Information about future TOS versions

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-13 09:26:16 UTC
From: HAC041@DJUKFA11.BITNET
Message-ID: <92013.092616HAC041@DJUKFA11.BITNET>
Source record: 46147

In article <1992Jan11.021210.28484@atari.uucp>, kbad@atari.uucp (Ken Badertscher) says:
>
>We will release information about it when there's real information to
>release, but when the thing's still in development, and a lot of specs
>are still very liquid, there's not much to say. Ok? Ok.

Even if there are no definite technical details at this time, some kind of information would nevertheless be valuable for developers right now. First of all there are some general considerations when programming for multitasking systems, like the dialog box problem recently mentioned in a quote from Bill Rehbock (which I would really like to see in full; could someone on GEnie perhaps post a copy?). These changes are due to different user habits made possible by multitasking systems, or due to fundamental technical differences. In this respect it would be helpful for developers to know what type of multitasking system the TOS is going to be.
Is it preemptive? Is it coarse-grained or fine-grained? Does it support multitasking for GEM applications only, or also for TOS applications (and what happens to console I/O in that case)?
Does it offer some kind of protection of processes from each other?
What kinds of interprocess communication are supported? Is it possible to share program code between processes?
Such design decisions must already be decided, if test versions are out already, so why not make this information available?

Another important information for developers would be on which machines it will be available, i.e. will it be restricted to TTs (which have PMMUs) or will it be available for the whole ST/TT range? This decision will determine the number (and 'category') of potential customers for multitasking applications.

>
>Thanks, Rob.

The problem is not in termcap, it's in the fact that the special keys on the ST (like the cursor pad, f-keys and so on) don't send a ASCII string, just a scan code, and s/w ported from Unix doesn't know about scan codes. I'm an avid Bash and uEmacs user (both compiled from source), so what I did was to write a silly (well, not _that_ silly) little program which does the following:

1. Rebind some of the special keys to emacs-style equivalents (eg. left cursor to ^B, shift-left to ^A, and so on) using the XBIOS Keytbl() call, then

2. run a program (given as arguments, for me this is normally mint.prg), and

3. rebind the keyboard using Bioskeys(), so that normal GEM programs don't get confused.

If any wants, I could post source, but it's a trivial little program to write.

Fast Basic can do that. I can't remember exactly how, as it's years since I've
used FB, but I **THINK** you copy the file into the clipboard and then save
the clipboard. FB saves this as ASCII.
Loading ASCII is easier; just choose your file from the file selector and FB
converts it automatically after loading.
Of course if you don't have FB then you're stumped really.

Assuming you've got fast basic (or can find someone who has), just load the
program in, copy it (in its entirety), then save the clipboard (drag its
icon to the floppy icon). That's it!

Oops. Not having worked with the national character sets, I had a blind spot turned to this aspect. Ok, leave it at 256 bytes. I can't seem to abandon the mindset acquired back in the old days when you measured a machine's memory in tens of K, not tens of M.

Another side benefit of using a table-lookup for strcasecmp is that you don't do multiple evaluations of each argument, yet you can still use a macro to do the operation. Wish I'd thought of the idea, but I stole it.

Brian.

Hmm, all the programs I have seen are merely switchers (they switch your monitor to 50 or 60, then reboot the system). They enable US machines to play euro games that don't automatically set the correct Hz (which most of them thankfully do).

There are pots in the monitor (white plasic with a screw slot on top).
Some are marked, some are not. There is a "focus" one that might help
you out, in addition to Vsize and Hsize. Mine looks very nice (expanded),
so I don't think the fuzz thing applies strictly to increased size.

154. ICD host adaptor, which one?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-13 17:14:58 UTC
From: u1398@jsp.umontreal.ca
Message-ID: <1992Jan13.171458.24661@jsp.umontreal.ca>
Source record: 46152

Someone who knows about ICD host adaptors may be able to help me out:

I just got myself a "Quantum Prodrive 80S". I dont know how fast it is supposed to be (I was told about 15ms-20ms). I attached it to "an original ST Host Adaptor" by ICD. Is this Host Adaptor too slow for this hard drive?

I ask this because I heard somewhere that ICD makes faster host adaptors (perhaps called "ICD ADscsi") or large/small ones that run better.

My current host adaptor claims the drive is 26ms and runs at 673K/sec.

Will buying the more expensive/faster ICD host adaptors improve this speed or is the speed I claimed really the top my ST can pull out of the drive?

>
>What is this size and can it be "fixed" to increase it?

TOS 1.0 and 1.2, 16mb. Tos 1.4 and greater, 32mb. These are per partition.
If you use the ICD host adaptor (a good choice), you can use BGM partitions
of any size, but some software will reputedly not work with them (however,
for storage of stuff they work fine). Can anyone confirm/deny this?

You are also restricted to drive letters A-P.

Atari-ST RoundTable
Category 14, Topic 4
Message 20 Sat Dec 14, 1991
B.REHBOCK [Bill@Atari] at 03:45 EST

The main problem that we have experienced with developer's going straight to Line-A is that they tend to also go around all of the other set-up procedures required to get along nicely with desk accessories, potential multi-tasking, etc. For instance, using Line-A to draw into a window, assuming you're the only application around, so you don't flag wind_update during your drawing. We warn against developers using it, simply because as the O/S and hardware mature, it will get harder and harder to use. For guys like the Codeheads, Gribnif, Ditek, etc. they have the sense to check with us at Atari to see if anything is going to turn around and bite them in 6 months, and they know how to cover themselves. The novice user writing share- ware (I mean developer) is much better off sticking to the book. The users that use the software will be happier in the long run, and they will have much less grief. There could come a time when the set up for graphic primitives will be set up in the registers of a graphics co-processor; the board may not even be ours. The driver for the board may not support Line-A but will know how to do VDI calls really, really, fast. The whole Line-A issue is a strong recommendation from Atari to ensure guaranteed upward compatibility.

-Bill @ Atari

Atari-ST RoundTable
Category 14, Topic 4

Message 21 Sat Dec 14, 1991
B.REHBOCK [Bill@Atari] at 04:39 EST

Just a few quick programming considerations so that software written can keep
in step with product developments...

1) Your user interface should always be made up of MOVEABLE windows
and a MENU BAR. Static Dialog boxes are bad, very bad, and really
really, really, irritate users on a multi-tasking system, because
they generally take control, and leave the user with no ability
to get at their other applications.
2) If the window is not being used specifically for status output
(such as the up/download status in STalker) or as a toolbox (the
toolbox in PageStream or Touch-Up), you should allow the user
to resize it, and supply the user with scrollers and arrows.
3) For consistency, you should have at least Desk-File-Edit menu
items in your menu bar.
(unless completely unappropriate, of course :-) (It's ok to replace
"Desk" with the Fuji.)
4) The keyboard equivalents for Cut, Copy, Paste, and Print should
ALWAYS be <CONTROL> (NOT <ALT>) X,C,V, and P, respectively.
5) If your program has a status box for anything, like upload/download
or printing progress, it should be in a window, and not continuously
bracketed in a wind_update. Please use wind_update as little as
possible.
(TOS 2.xx/3.xx gives the user 7 windows, future versions will have
no limit)
6) Make no assumptions on what type of system the user will have. Be
able to deal with everything. There are many 24-bit color solutions
in the works, going up to 1280x960. (As far as I know, but I'm sure
bigger will be coming soon :-)
There will always be monochrome systems also, so it can't be
ignored either. The two third-party 24-bit VDI's that I've seen
both virtualize the normal 256 color TT palette. That is, once
a palette color is set, then used to draw with, changing the
color of that palette register does not change the color on
the screen. This keeps applications from doing palette-shift
animation, (such as Neochrome) but does not effect any other
color-oriented applications in an adverse way. (Calamus SL and
PageStream and Chronos and Prism Paint should all be just fine.)

I hope this points people a little bit better in the right direction.
There is a lot of neat stuff coming down the pipe from third parties for the
TT and MegaSTE in 1992. We would like to avoid the kind of compatibility
problems that people had when the Moniterm first was introduced. When
multitasking hits, there is no reason whatsoever that applications written
today shouldn't work immediately with it.
-Bill Rehbock, Atari Corp.

Yes, you can. You should do it before the menu_register(), and see whether the rsrc_load() is successful. If not, go to an evnt_timer(-1L) loop. Although you shouldn't do too many calls before the menu_register() in general, but I can't give a definite number for that.

This message means the MiNT kernel is out of memory at a time when it's trying to keep track of yet another Fsfirst call by the Desktop.

I think there's nothing for it but to recompile MiNT with a larger value for KERNEL_MEM found in mem.h. That's really too bad, but I don't think there are any alternatives.

Source record: 46164

Is there anyone that could tell me how to switch between 8 and 16 MHz
on a Mega STE without using the control-panel? I suppose it can be done by
altering some bits on a high-address, but I don't know what bits and what
address. I don't feel like disassembling the control-panel, so any help
would be apreciated.

Does anyone know where I can get my hands on the new floppy-chip (the
so called AJAX-chip) that can handle 1.44 and 2.88-meg drives? I called
Atari-Sweden but they said it COULD take up to half a year before it
reaches Sweden, and I don't feel like waiting that long.

Also, is there someone that has some info about the DIP-switches in the
MSTE? I know what DIP-7 is for (HD-format from desktop), but I haven't
got a clue about the others.

161. Spectrum Code Fix?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-13 23:11:43 UTC
From: stevendd@mentor.cc.purdue.edu
Message-ID: <31022@mentor.cc.purdue.edu>
Source record: 46160
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

A while ago the source code to display a Spectrum picture was posted. This code worked great until it exited, and then it locked up. Does anyone have the code to allow this program to exit correctly?

Its possible that I may be at fault, since my compiler doesn't have an "illegal" macro. Which might make the program end properly.

If you know how to modify the formentioned program to make it exit correctly, or if you have another version all together let me know.

Thanks a lot, Doug.

From: genius@sys6626.bison.mb.ca
Message-ID: <5LTieB2w164w@sys6626.bison.mb.ca>
Source record: 46165

Or a program can do like STalker 3 does and, if you choose to turn the scroll bars off (therefore disabling the sizer box), just click on the bottom right of the window with the right mouse button depressed and that will simulate a sizer box press..and you can size the window... I find this option VERY useful, because with a term emulator, you need 80 columns, so I disable the vertical scroll bars...but I can still size the window.

Sure, why not? I've seen it done this way on many Mac applications. But
for myself, most of the time I'd like to be able to have JUST horizontal
scroll bars, or JUST vertical scroll bars... in which case the SIZER box
is right where it's always been.

From: marshall@cs.uq.oz.au
Message-ID: <6120@uqcspe.cs.uq.oz.au>
Source record: 46167

Dear DC people: you kindly sent me a prize of DataDiet. Unfortunately, my ATSpeed adaptor in my MegaSte was kaput, so the machine went into the hospital for weeks, while i waited for a replacement from Germany via UK! now it's back,, and I tried to install Datadiet.
but it keeps saying: "Not installed - maybe needs registering?".
I did register it, but only AFTER copying it to my backup and to the hard disk. Actually, I dleted the stuff from the h/disk, and registered on the floppy.Then I recopied the auto stuff, but not the *.app's, since i had not deleted them anyway. In short, i cocked it all up!

Now the registration prog has disappeared from both the Master and the backup floppy, and I can't get Datadiet to run. The config only shows the info and calories buttons - dietize and normalise are disabled.
What do I do now? Sorry I didn't do it right! I'm desperate, as all my mates are waiting to see how it runs! Thanks for any help you can offer.

I've noticed the latest type of hard drives (at least for the IBM
world) now uses the IDE controllers. I have an old ICD adapter
card which accepts only MFM drives. I'm planning on buying a
new hard drive but I'm not willing to spend money on old technology.
Is there a way to build a cable for the ICD adapter to accept
IDE drives?

169. 32 colors on an ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-14 08:39:01 UTC
From: sslee@micromed.net.netcom.com
Message-ID: <q87ieB4w164w@micromed.net.netcom.com>
Source record: 46176

I've heard many people say the original ST was to have a 4096
color palette and 32 colors simultaneously in low res. The
4096 was realized in the STe, but we are still stuck with only
16 colors (without any special tricks).

The Shifter chip, which determines the color registers, has
five pins dedicated for this. Therefore, 2^5 is 32 color
registers. Currently, the hardware color registers are
located at $ff8240-4ff825e (2 bytes/color register). It seems
one of the pins is not used unless it is used to access
$ff8260 (which determines the resolution).

Is it possible to modify the ST so it will recognize 32 color
registers? Other than the fact that no one else will have
this capability, I don't see why it can't be done and not
affect any other software. Are there consequences to doing
this (ie future TOS will not work)?

(I meant the registers are located at $ff8240-$ff825e not 4ff825e)

There's a TOS routine for changing the size of i/o buffers - can't recall its name off hand but you'll find it in any decent TOS reference manual.

However this probably won't fix you problem - ST's lose a lot of midi bytes to overrun errors on the midi ACIA - what happens is that some other level 6 interupt routine locks out the midi interupt for more than the 320ms between midi bytes - the worst offender is the keyboard/mouse but the 200Hz system clock can also do this.

The only real fix is to write your own interupt code which is more difficult than is ought to be because the midi and keyboard/mouse IRQ lines are wire OR'd together and feed an edge rather than level triggered device so you have to handle both ACIAs to stop them from locking each other out.

I myself have a 60MB harddisk. I was a original Megafile30, but i got a
60MB RLL from a friend, which i put in instead.
I formated it with AHDI 3.01 and also use this driver.

The first few months, i used 6 partitions, all smaller than 16MB, although
i use TOS1.4.

One day, i backuped my harddisk and reformated it (there were several new
errors...), and decided to try larger partitions. First, i tried up to
30 MB. That worked fine with all programms, except some very old ones.

But as i used greater partitons than 32MB, nearly every programm didn't
work anymore, which needed direct sector-read access. For example SED440
didn't work anymore, and it's one of the best german disk-monitor programms.

So i changed again to less than 32MB and everything worked fine again.

By the way: The CBHD, the driver of the SED didn't work with these big Partitions, too...

Phil.

173. Of 3.5" drives and IDE Controllers...

Hello out there? ./`
Is there anybody out there? ./`

If remembering lines from Pink Floyd were my only problems at the moment, I'd be a happy guy! But alas, they are not.

You see, I have these two little questions that I am SURE have been asked here before, and would like some feedback about them....

1) How much trouble is it to take a standard IBM 720k 3.5'' drive and swap it into my Atari 520STfm? I ASS/U/ME that is all that they do, for when I had to repair my ST drive, I noticed a striking resemblance.

2) I have this IBM IDE controller and a Maxtor 120mb hard drive. What all would it entail to make this thing work with my Atari ST? I know that I'm gonna have to custom build a case (or find a small metal box), and that it will have to have it's only power, and that I'm probably gonna have to find some really wierd/rare parts to complete this task.

Basically, can anyone PLEASE give me some simple-to-follow instructions that would remedy these problems?

Thanks alot to anyone who HELPS me..

Source record: 46178

You man want to reformat with a different format. I forget the correct term, but the ICD software lets you intersperce you're sectors so instead of the sector order being, say,

1 2 3 4 5 6

It mignt be

1 4 2 5 3 6

or

1 3 5 2 4 6

The advantage of this is it give the controller & computer more time to get ready for the next sector. If they aren't ready, the disk has to spin all the way back around, slowing access down. By spacing them cout like this, they get ready for the next sector just in time for the sector to pass under the r/w head.

Hope this helps.

There is a hack (RAM) for TOS 1.04 (and nothing else) done by. M. Osieka
allowing up to 128 windows. It is an auto folder program and the program
name includes the maximum number of windows.
The Atari-Desktop itself for what reasons soever does not support more than
4 windows but some/most programs do and Gemini, my favourite desktop,
fortunately does, too.

The guys there didn't allocate the memory for window data
dynamically, but used a fixed sized array! I'm shure!
Similar mess as with folders. (At least to the user!)

> Are there any versions of TOS (Atari's or other's) that allow more than 7?
No!
But there's a program floating around, which allows you
to access more windows. It's of the same fashion as the
FOLDERxxx.PRG.

4 questions [concerning the TT, SST, ASV]...

1. If I buy a TT, will I be able to use the GCC compiler available at
Atari Archives on it? Can GCC produce 68030-specific code?

[I just learned C, and havent tried it on Any Atari yet.]

2. Is there an Assembler specifically for the TT? If so, can someone
tell me which company makes it, and where to get it?

3. Is there a graphics expansion to work with the SST by Dave Small,
should I decide to not buy that TT?

4. How long before Atari's System V Unix is made available for the
TT? Ballpark would be fine.

From: cse0507@desire.wright.edu
Message-ID: <1992Jan14.233853.1380@desire.wright.edu>
Source record: 46044

So what is the proper way to code for 24 bit boards? Is virtualizing the palette going to be the way to go? So, one would check with the VDI, get back >32768 colors, but a palette is in use. Or, would the "no palette" signal 24 bits? Also, what about 32 bits- 24 bit color with 8 bits of alpha channel? DKB Raytracer would've been ported by now, but for these questions. Yes, other than that, my code follows B.REHBOCK's suggestions, but I'm not putting half-baked (by my lights :-) crap out to the net. I have a TT and know what a gripe it is to find programs that didn't bother to make that simple call to the OS to find res, colors, etc. (SuperBoot 7.2 especially!)

?!?!?!

186. Problems with Word Up 3.0 and Mega STe

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-15 07:29:34 UTC
From: mmiller@isis.cs.du.edu
Message-ID: <1992Jan15.072934.8736@mnemosyne.cs.du.edu>
Source record: 46184
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

From what I've experienced with Word Up, I think it is an excellent concept. I got it with my system and I would really like to keep it, but there are some problems which make me very wary of it, and I am considering switching to another word/document processor, possibly of lesser features, if the problems cannot be remedied.

The problems I am encountering are:

- When there is no document open, and I want to open a document, it HAS to know that disk A is in drive A, otherwise it kind of crashes (I think it just goes into an infinite loop or something). But I am unable to do anything else. It just locks up. I can still move the mouse pointer though.

This does not happen if I have at least one document open. It will prompt me to insert disk A.

- If I just open and close single documents (not having more open than 1 at a time), things work out fine. But if I open more than one document at a time, it seems that I have to close them in the reverse order that they were opened, otherwise the next time I want to open a document, it crashes with 3 bombs (address error). I have sometimes noticed that if I have 3 documents open at one time, and if I alternate between closing and opening the 2nd and 3rd windows, I can avoid a crash...for a while, but eventually I get the 3 bombs again.

Being a programmer myself, I think I have a sense of what is going wrong here. It looks to me like Word Up is not managing memory well as far as maintaining memory for documents that exist in memory, and loading new ones. I thought that if a 1st document was opened, and then a 2nd, and if the 1st document was closed, that the 2nd document's contents would be copied to the 1st's place, starting at the 1st's starting pointer. This way one could load another 2nd document without worrying about stepping on another one "somewhere out there." I get the feeling that the problem is being caused by something in memory remaining static when it's not supposed to. I mean, when I do the above operation, the 2nd document moves down to the 1st document's place in the Windows menu. But it does not appear, just to my intuitive sense, that in memory the 2nd document has taken the place of the first. It just stays where it is.

Either that, or else the program is getting its pointers confused. I don't know exactly what "Address Error" means. Is it an address that is out of bounds? I have a Mega 1 STe, so would an address beyond 1

Meg. cause an address error?

- In text mode, at least, almost every time I edit a line (inserting or deleting) it "shaves off" the top of the line below it, and moves that top part along with the line I am editing. Sometimes it seems Word Up is able to compensate, by moving the "shaved" part back, but usually it fails.

Other than these bugs, the program has worked great. I have had no problems using multiple fonts, using the spell checker, or printing in the various modes, with, and without fonts (text mode).

I heard a while back that Atari had acquired the rights to Word Up, and would be selling it someday. Does anyone know when they will be releasing their version? I assume they have made efforts to make it more STe compatible. Will they support existing Word Up customers with upgrades? That question was unanswered the last time I heard anything about this. I have been wanting to mail my registration form, but I heard that Neocept went out of business, and Atari got the rights to it. So I don't know where to mail it.

Is there a patch available somewhere that would fix the problems I am having with it?

If nothing else, could someone recommend good word/document processors that have the following features: multiple fonts (not just those that the printer supports), headers, footers, selective page numbering (like only putting the page number on all but the first page), a spell checker (among other advanced features), and is compatible with the Mega STe (or just STe's in general). Being able to put graphics in documents is nice, but for me it is just iceing on the cake. It's not really necessary. Please give company name, and price, along with the software title.

As an alternative to the VideoKey 'from the now-defunct Pratical Solutions' , there was an article on page 81 of the December 1989 issue of RADIO ELECTRONICS which described a circuit to convert RGB to NTSC (suitable for that Radio Shack RF modulator). Incredibly the article was specificly written for the Atari ST!! so you will not have to adapt it to the 1040.

Yes you will have to change the 5 volt TTL outputs of the PC, to the
0.75 volts that the Atari monitor needs, or good by monitor,
also note the input impedance of the Atari monitor is 75 ohms..

Well there are some problems with OEM drives, like media change, as Atari
uses the write protect line, this does not always work when the disk is
write enabled, ie, test this by setting the write protect on/off and
see if the disk is reread each time the Esc key is pressed, for each setting,
it some times can be fixed by connecting pin 2 to 28 at the drive or on
the back of the Atari main PCB.

Also some of the older PC drives use a 6 ms step rate,
the Atari uses 3 ms..

I don't know if there is a IDE host adapter yet..

I have also been told that you can't reformat a IDE drive..??

I'm unable to help you about installing programs such as you describe from pascal or C, but the way it's done from assembly language is to modify interupt vectors in low ram.
There is no reason to write another bomb-out error handler as one already exists in the PD. I think it was published on the STFORMAT cover disk, but sohuld be available at atari.archive, and is called NOBOMB.PRG.
I'll post example code of how to install interupt vectors from assembly language if you're still interested.

I would not state that SCSI is old technology, but I will state that IDE
is Cheap technology, you can't even reformat them..!!

From what I have read Atari is to standardise on SCSI as it can be
used on Printers, Scanners and Tape back things, I don't think this is posible
with the IDE buss, you can only connect 2 things to it, and I don't
think that it can run to far, not like the 6 m that SCSI 1 can..??

I sent for the kit of parts available for this project and it worked well. I was able to display a decent image on a large composite monitor and record stuff on a VCR (even medium-rez text). A TTL inverter chip included allowed the circuit to work with CGA video from a PC (but not EGA or above) if so desired as well.

> [I just learned C, and havent tried it on Any Atari yet.]

Yes, it will work nicely. It doesn't produce 68030 code, but it does do 68020 code, which is pretty well the same as 68030, it also supports the 68882 maths co-processor which is built into the TT.

>

> TT? Ballpark would be fine.

All I've heard is that it will be available "real soon now" and that it will need the 19" mono monitor to run Motif.

I don't know if it will run at all on the 14" colour TT monitor.. does anyone else know?

miskinis@aidev.enet.dec.com (John Miskinis) writes:
|>
|> This is true... I wrote my own level 6 interrupt handler, which I then
|> discovered dictated that I write my own "windowing system"...

The problem with writing your own level 6 interupt handler is that you have
to handle both midi and ikbd input otherwise the ACIA's could lock each other
out. Once you have read the ikbd input you then have the problem of
giving to it
TOS/GEM. There isn't any documented way of doing this to my knowledge so that
is probably why you wrote your own window system.

Actually there are a couple of ways around the problem without resorting to
this measure but they are rather complicated and its very easy to make a
subtle error that will bomb under rare input conditions. The basic
idea is to make the TOS handlers interuptable by lowering the IPL but
remember TOS handlers are (mutually) non-reenterant and may bomb if a
second TOS handler executes before a first one has completed.

It took me 4 weekends and 80+ crashes to figure out how to do it right
(would have been 3 weekends but for a nasty bug in Sozobon JAS assembler).

BTW at least one commercial sequencer "solves" the problem by
disabling the mouse during record (ugh!).

You may be interested to know that
when I first hit the problem I trawled through some archives at lancs.pdsoft
and found several of your postings on the subject.
When I trawled through the same archives some weeks ago I saw your
posting mentioning your solution. Actually since the TOS/GEM code is so
inefficient its probably worth writing a window system from scratch for a
commercial product and this is what I might do for my next sequencer
(if I ever find the time to write it...)

|> this (ie future TOS will not work)?

I can think of at least 3 problems:

1. The extra registers might not actually exist on the shifter chip.

2. Where will the extra bit plane go? remember on the ST the bit planes are
interleaved.

3. When will the extra bit plane be accessed? there are only so many memory
cycles in a scan line.

"is there an assembler specifically for the TT?"

Yes, Devpac TT manufactured by Hisoft in the UK. It costs abour 120 UKP
and includes a very pwerful debugger.
I have it and strongly recommend it.

206. Supra Hard Disk Interface

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-15 22:52:05 UTC
From: Jean-marc.Zucconi@bbs.oit.unc.edu
Message-ID: <1992Jan15.225205.3245@samba.oit.unc.edu>
Source record: 46054

I have problems connecting some Hard disks to a Supra HD adapter.
I can use a Quantum P40S (42 Mbytes) but not a Quantum LP105S (105 Mbytes)
nor a Fujitsu M2614S (180 Mbytes). The problem with the LP105S and the M2614S
is that they do not appear on the bus ('DMA device not responding') whatever
their SCSI number is. Clearly the problem does not come from the software
since the result is the same with the ICD formatter.
Does anyone know why some hard disk can't be used w/ the Supra
adapter?

Thanks,

Jean-Marc Zucconi

207. Re: GCC 1.40 on the TT

>> TT? Ballpark would be fine.

>All I've heard is that it will be available "real soon now" and that it will
>need the 19" mono monitor to run Motif.

The release is pending (it's in something akin to Beta now, having been
released to selected "developers").

>I don't know if it will run at all on the 14" colour TT monitor.. does
>anyone else know?

It's been run internally at Atari on the 14" color, but that version isn't
supported. Only the 19" mono is "officially" supported; there will be
some form of color support (probably only for larger screens, with an
add-on board) later.

If you've got a choice, and money isn't an impediment, I find the TTM195
monitor superior to the TTM194.

Is there anyone out there (Small for example) who knows if there will
be a Mega STE-version of the SST-accelerator in the forseable (sp?)
future? If so, will it be a VME-plug-in-card or something that fits
on top of the old 68000? How much will it cost?

209. Re: 1040ST Midi Buffer Size

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-16 08:09:27 UTC
From: miskinis@aidev.enet.dec.com
Message-ID: <1992Jan16.075105.7120@ryn.mro4.dec.com>
Source record: 46058

There are still a couple mysterious issues tha I'd like to nail down,
about replacing the level 6 interrupt...

If MIDI data, (and *sometimes* mouse data), is coming in while I
replace the handler, the machine freezes up occasionaly. It's not a
big deal now, as I can always make sure data isn't coming in when I fire
up my program. I would like to know why though, and solve this problem!

Currently, I have a 300 byte buffer for mouse events, and in the
interrupt handler, I just store the 3 incoming bytes in the cyclical
buffer. I thought I'd have to increase the buffer to a size much
larger than 300, but I've never been able to overrun the buffer.
The mouse "queue" is read in my main "event loop", and if there is
data to process, I update the mouse sprite position accordingly. I
noticed however that the mouse sprite flickers slightly when moved,
but the Atari standard mouse sprite doesn't. I would tend to think
that they are updating the mouse sprite in between screen refreshes,
while I update it whenever I need to. I remember seeing something
like a vsync() call, but I figured this would "block" for a while,
until a screen refresh has just happened. If anyone knows about this,
PLEASE post some info!

I originally thought about disabling the mouse while recording, but
that seemed to be an "uncool" solution, as a graphical interface to
a sequencer would suffer from the lack of a PAUSE or STOP button,
and then the issue of providing MIDI thru (reliably) would be
possible only when the mouse was disabled. I figured that since
I wanted to provide 100% data accuracy AND allow full mouse control
during recording/playback/THRU that I might as well rewrite the
handler.

There are some disadvantages to using a "home brewed" handler though:

1) The standard keyboard and mouse data structures are not filled, so
none of the standard system routines will work.

2) No screen savers are compatible, and if installed will be activated
as they think that the mouse and keyboard have been inactive!

3) By not using GEM, no desk accessories can be invoked.

At this point in time, I have no support for "double/triple clicking".
I've always hated mutiple clicking myself, and may never implement it, as
I don't think it's an important component in a user interface. This
is just *MY* opinion, and I'm sure there's a lot of people out there
that will disagree with me.

Because I'd like to someday offer some comercial software for the ST,
I didn't mind investing the time and effort to develop the handler,
and "windowing system". I would not recommend doing this though,
unless you have a LOT of time, and are not easily frustrated. I'm
still working on the windowing system, and although I have the basics
complete, I know that I still have a long way to go...

I currently support medium-resolution only, as I wanted color, and
a decent resolution. I may have to support monochrome in the future,
but I don't know how good the 3D effect will look using dithering to
achieve different levels of gray. I currently use the 4 colors in
the medium resolution to their full power, and although it's possible
to get decent looking screens, I sometimes wish I used low resolution
for 16 colors would be REAL conducive to 3D effects!

I will most likely post a binary in a few weeks (if people are interested)
that illustrates what I've been working on. I've got a 61 key piano
keyboard on the screen, that lights/unlights the keys as they are played.

Currently 4 sliders indicate pitch, VCF (controller 2), Oscillator (controller
1), and aftertouch in real-time. Although the MIDI data is recorded in
a fixed length buffer (50K now), I have not incorporated my playback
routines into this. Also, I have not tested my windowing system with
a timer A rundown interrupt routine updating a clock. I sure hope that
I don't get any suprises when I fold these routines in!

ANYWAY, enough rambling for now...

John

210. Atari developer documentation

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-16 08:56:44 UTC
From: steve@thelake.mn.org
Message-ID: <A387323952@thelake.mn.org>
Source record: 46069
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

The following announcement was made available on GEnie by Bill Rehbock.

January 15, 1992

Atari Corporation Official Announcement

I am pleased to announce that Atari is making all of the released TOS development information available to the general public. We are making the kit available to fulfil the needs of programmers that already have purchased a third-party development package, Atari owners that are curious about the 'nuts and bolts' of The Operating System, and anyone else that wants to have a detailed understanding of TOS software development. If you wish, you may purchase the entire kit for $150.00 (U.S.) and also get one year of technical support from Atari via the private Atari Developer Roundtable on GEnie, 6 issues of the bi-monthly Developer Newsletter, ATARI.RSC, and one year of on-going developer kit upgrades. If you wish to renew after one year, there is a fee of only $40.00.

If you wish information on only certain aspects of Atari TOS computers, we also sell sections of the kit separately. The items that are available range from every issue of the developer newsletter since 1985, to the release notes for the exciting new STBOOK. Every detail a software or hardware developer could want is outlined, including MegaSTE/TT VME Bus specifications, STE DMA sound, FSM GDOS programming information, and more. Please see the order form for details.

You must purchase the $150.00 full kit to be eligible for on-going support. I'm sorry, but at this time, you may not purchase a part of the kit, and later "upgrade" to the support level.

Developers that are currently not registered with Atari, and have a commercial product on the market, or have a product in development, or have any other special needs requiring direct unlimited telephone support should sign up under the Atari Commercial Developer Program. There is an additional fee for this program, but there is no renewal fee required as long as you continue product development and support. (Educators, universities, and businesses may fall into this category.) Please contact Gail Bacani on 408-745-2022 for more information on the Commercial Developer Program.

The complete order form follows, outlining all of the documentation that is available. Please note that several items include disks

containing software relating to the documentation. We want to assure that you get the most out of your Atari Computer experience!

Sincerely,

Bill Rehbock,
Director of Technical Services, Atari Corp.

Included in this archive, please find the file, ORDERFRM.TXT. It outlines all of the documentation that is available, pricing and ordering information.

Atari TOS Developer's Kit -- Order Form -- January 4, 1992

_____ $150.00 Complete Developer's Kit, including all documents and disks. Includes 1 year of support via Atari-RSC Developer Roundtable on GEnie, on-going developer kit updates for 1 year, and 6 issues of ATARI.RSC, the bi-monthly developer newsletter.

_____ $40.00 One year renewal fee -- 1 year of support via Atari-RSC Developer Roundtable on GEnie, on-going developer kit updates for 1 year, and 6 issues of ATARI.RSC, the bi-monthly developer newsletter.

>so you will not have to adapt it to the 1040.

WOW! Did they say how well it worked, or how hard it was to build?

Also, is Practical Solutions really defunct? I just picked up a cordless
mouse made by them (cheap), perhaps that's why it was cheap. I noticed
that once in a while if I move the mouse quickly to the left about an
inch or so, 5 times in a row, it will miss one movement. Is my
warranty useless?

ANY and ALL infomation is appreciated,

John

This will not work, Please don't insult you Atari and do get a proper monitor
for it..

But I did see a Sony TV with a scart input work ok for games, but I
would never recomend any thing lower than that..!!!

They come with the DMA cable, but you will need a 50 way cable for the drive
and a 4 way for power to the drive, and posibly a cable (power) to the adapter,
but that one could be suppied..

E-Mail me if I can help some more, I have a home brew SCSI 50 meg drive
that I made up myself..

Is this the old Supra one, ie, no clock, its not a good design,
also some of these drives need a reset command to get them going, that
from what I have read in some of the ICD Docs's, ICD provided a reset
program to put into your Auto folder to fix this...

|> in a new drive and flippin DIP-7.
|>

I've tried to use a HD-module from an ordinary ST, which does nothing
more than to switch the WD1772 to 16 MHz clock rate. But I'm sorry, it
doesn't work reliably. From time to time the bios reports CRC-Checksum
Errors. I don't know if this is just because of badly placed 16MHz lines
(but I think that's the reason) or if there really has some programing
in the BIOS got to be done. Since in the MEGA-STE the computer tells the
floppy which density to use and not the floppy indicates which kinda disk
is inserted, the BIOS must make two attempts to read a disk, switching
the WD1772 clock frequence. Normally, the BIOS can handle disks with up
to n sektors per track, where n is a positive integer number greater than
a, and a may be choosen freely, but perhaps the floppy controller must be
programmed a bit different and the BIOS doesn't do this. In a way it's
said that ATARI didn't release the MSTE and TT with HD-floppies because
of "some troubles", but it was never explained what the troubles were.
Nevertheless I will try the above mentioned method and may be back with
some good news in some days. The WD1772-02-02 (the -02-02 is important)
is definitetly said to be able to handle 16 MHz, so where is the problem?
Anybody who knows about this is invited to mail any comments.

In article <5133@charon.cwi.nl> eker@cwi.nl (S.M. Eker) writes:
> There's a TOS routine for changing the size of i/o buffers - can't recall its
> name off hand but you'll find it in any decent TOS reference manual.

Actually, there's not a routine for it, but it's easy enough to write yourself. The critical information you need is that XBios routine #14 (IoRec) returns a pointer to the buffer parameter block for the serial I/O devices (the MIDI port is device #2). The first entry in the block is a pointer to your input buffer, the second is a word with the buffer size (followed by head and tail index words).

One thing to note is that the ROM routines (at least up through TOS 1.4) won't handle buffers larger than 32 kB. So if you want more than that, you'll have to write your own interrupt handlers.

Also, don't forget to restore the original buffer block values before exiting your program.

> However this probably won't fix you problem - ST's lose a lot of midi bytes

> level 6 interupt routine locks out the midi interupt for more than the
> 320ms between midi bytes - the worst offender is the keyboard/mouse but
> the 200Hz system clock can also do this.

This is really weird. I keep reading about how the Atari loses input data on it's MIDI port, and how the only way to avoid it is to write your own MIDI interrupt handlers. I've been doing MIDI on the ST since 1987 (when we released our Omni-Banker ST universal MIDI librarian), and have neither lost MIDI data, nor written my own interrupt handler. The program is in use on every version of TOS, with every nationality of ROM, all over the world for the past 5 years, with NO reports of data loss of this kind.

It's true that the mouse can generate a lot of interrupts very fast, and can result in MIDI data loss. But it's very easy to send a message to the IKBD processor to disable the mouse during the short period of time that data is being received. (I'm talking here about librarian type applications. If you're writing a continuous real-time application like a sequencer, shutting the mouse off may not be an option, and the custom interrupt handler approach is probably required.)

It's not true that the 200 Hz system clock generates enough overhead to cause data loss. I know, because Omni-Banker relies on periodic checks of that clock to determine whether data dumps have timed out. I can dump 15 kB from a Yamaha RX-17 drum machine at 325 uS per byte into Omni-Banker without loss. What may be surprising is that I've left

the input buffer at it's default size of 128 bytes, and the data capture loop is written in OSS Pascal (with no assembly code). (I pull the bytes out, examine them to see if they should be filtered out, check for EOX terminators, check the timing, and stuff them into my own buffers... all in real-time, all in Pascal).

The key factor here is to avoid the Bios-level I/O routines like the plague. The bConIn and bConStat routines that you would logically use for this purpose have about a 1 mS overhead associated with them. In the time it would take to check the status and read one MIDI byte, SIX bytes have arrived. You'll overflow the buffer pretty quickly that way. The situation gets even worse when you have several AUTO programs that patch themselves into the system vectors and check everything that goes by (extra overhead).

Another area that *might* result in data loss is if there are many routines hung off the VBI chain. I don't know for sure about this, because I had already shut off all but the first entry (the GEM timer), in an attempt to avoid data loss, before I came up with my fast input data collector. I never bothered to re-enable the VBI chain to see what impact it would have.

It's at a rather low frequency (only one blip every 40-60 MIDI bytes), but what's important is the total time consumed by all the routines in the chain. My collector requires ~100 uS to process one byte, plus maybe 40 uS or so for the standard interrupt handler; leaving less than 180 uS worst case for everything hung off the VBI.

However, the MIDI port is attached to the MFP chip, which is at a higher priority level than the VBI, so input data would still be collected, unless a VBI routine was badly behaved and set the interrupt level up, locking out the MIDI port (for >150-180 uS). Probably pretty safe, although in a commercial application, I wouldn't want to risk it.

Hopefully, this analysis will prove to be useful to someone. And to place your order for this unbelievably fantastic universal MIDI librarian that supports over 300 instruments!, just call... :-)

Just kidding! ;-)

I'll just mention that the 200 Hz system clock is Timer C, which is level 5 on the MFP, and can't interrupt the MIDI input, which is on level 6 (i.e., a higher priority level).

Just out of interest, does anybody know how GEM chooses to order accessories on the "Desk" menu? Is is just "directory order" (i.e. the order that Fsfirst and Fsnext supply them), or is there a deeper rationale ?

I think I have the pin-out for the Xformer cable somewhere, but it'd take me a month or two to find it <grin>. If you don't need Xmodem transfer there's a file on Atari Base (408) 745-2193 that shows how to hack a joystick cable to RS232 (RS232JOY.ARC) it'll go to 19,200 BAUD, but the ST can't capture that fast. For regular handshake type stuff, Xmodem, you can only go to 300 BAUD, but it will do two way transfers.

I have a disk with partitions up to 240 MB working fine on a Mega with TOS
1.2. The host adapter is a BMS 200. The key is in the hard disk utilities:
I believe HDX 3 or higher is needed to get partitions bigger than 16 MB.
The version I'm using (5.something) is supposed to be in general release,
but the ways of Atari can be a little confusing to outsiders, so maybe
it isn't.

I'm having trouble with gcc (again). After seemingly having
it working for a little while, it's hassling me again.

If I try to compile

```
#include <stdio.h>

main ()
{
printf ("Hey there\r\n");
}
```

gcc gives me the following error:

In file included from hmm.c:1:

e:\gcc\include\stdio.h:115: parse error at null character

(I guess some of that stuff is mupfel control codes.)

I'm using gcc 1.40 on a 2.5M STe, using gemini (mupfel).

Sorry lads. This may not be the correct newsgroup for this message, but it's the ONLY ST Newsgroup that are hub is pulling in. Please bear with me. :)

I'm just working the FINAL bugs in my first ever game. An 8 sided dice version of Triple Yahtzee for Monochrome STs.

Couple of questions: I'm programming in GFA Basic 2.0. I've never programmed seriously, in any other language, and don't have a LOT of programming knowledge, and DO NOT have a manual for this basic. (It being PD, I got it from a friend, but he had no manual).

HOW can I print something graphically to the screen, WITHOUT the mouse blinking? (As in the numbers for the 'rolling' dice in my game. When the die are rolling, (about 20 times/second) the mouse blinks at the same rate). I would LOVE to get this fixed before I release Version 1.0 of this shareware game.

Other than that and a minor bug or two, the game is ready for release.

Also, is there anyone out there, that I could mail a copy of the game to, so that they could upload it to somewhere on the net, that has an ST downloading area, or to Compuserve? Doing this favor for me would include a registered version of the software. (Putting you on my registered owner mailing list, which entitles you to a free copy of all updates, upto and including Version 2.0 (BUT, only including 1 mailing free. I can't pay for postage for every update between major versions). Version 2.0 will support colour monitors, and MIDI for sound support.

Thanks for ANY help on this!

The problem I've encountered with >16 meg partitions is a problem
with sector editors. To have >16, you need to increase the sector size
beyond 512 bytes. Most are designed to handle 512 and nothing else. I
would imagine, however, that there are editors available. (Disk space and
usage can get screwy as well.)

I think there's some confusion here - all MFP interupts run at IPL6. There
are sublevels implemented on the MFP chip but one IPL6 routine *cannot*
interupt a second IPL6 routine unless the first lowers the processor IPL
regardless of the routines relative sublevels. Thus it is only neccesary for
a MFP interupt routine run for more than about 300us for the possibility
of a midi-ACIA overrun to arise. I think the 200Hz timer routine in TOS is
borderline and therefore for it to cause a midi-ACIA overrun it must run
just microseconds before a midi-ACIA interupt occurs - this is a rare event
even at full midi bandwidth.

>There is a known bug in the time zone handling of zoo 2.1. I have
>heard that it will be fixed in the next release. I do not know when
>that will be.
>
>To avoid the 1 hour creep that you report, you need to tell zoo your
>time zone. Set your environment variable TZ to tell the number of hours
>west of GMT you are. I have my variable set as:
> TZ=est5edt

This put me onto the right track. I have been using GULAM as my
command line interpreter, and I and tried
set TZ est5edt
but it did not work for me.

At the suggestion of Nick Castellano, (entropy@gnu.ai.mit.edu), I tried
setenv TZ EST5EDT
Now ZOO time handling works great, and I am no longer getting the
unwanted one hour time advance.

As a consequence, ZOO is now my archiver of preference.

Thanks to all for your suggestions and help. For most elementary
operations these four aliases do what I need, both on the mainframe
in the machine room, on the ST on the desk in the office, and at
home.

```
alias za "zoo ah"
alias ze "zoo e"
alias zl "zoo -l"
alias zt "zoo -t"
```

If you like them, you are welcome to have them.

I've never noticed a problem but then I've never looked for it. I can't
think of any reason for the machine to freeze if your replacement routine
does the job properly (which isn't as simple as it appears). You don't say
how you're replacing the handler. The safest way is with an atomic move.l
from your main code (ie not in an interupt).

Debugging interupt routines is a real pain (especially when you have
a rats nest of interlocking interupt routines synchronising via semaphores
and interupt masks such as I use for the real time parts of my sequencer).
A device which has saved my sanity on several occasions is one of those
"cracker" cartridges which people use to pirate games (mine is called
"Ultimate Ripper" from Power Computing).

What TOS does is to check whether the mouse has moved during the VBI and
redraw it if so, ie the redrawing is done in an interupt routine rather
than in the main loop. This can be a real pain if you want to redraw the
screen in an interupt routine yourself (for real time displays).

|> I originally thought about disabling the mouse while recording, but

|> handler.

Yes, thats the only decent way to go. Approximately a third of the code
in my sequencer is handcrafted assember interupt routines to do all real time
record/playback/thru and sceen updating. I've got thru latency down
to an average of about 2ms.

|> There are some disadvantages to using a "home brewed" handler though:

|>
|> 3) By not using GEM, no desk accessories can be invoked.

These only apply if you don't return the ikbd data to the TOS routines and
instead implement your own mouse/windows etc.
As far as I know only the high end commercial sequencers take this route
though its probably the best.

Yes. If your sequencer is going have the fancy features to match your
snazzy window system theres lots of other tricks you need to know. Apart from
the real time features my own effort is a rather bare bones affair - I spent
all my time worrying about optimal record and playback precision across lots
of tracks and forgot about things like graphic editing.

Fixed buffers are a real pain when you have many tracks - I went for singly linked lists. You might be in for nasty suprises when you add the timer A stuff interlocking interupt routines can be subtle things...

The solution is not to update the mouse sprite position during your main "event loop". Stick the new mouse coordinates somewhere, and install a routine on the vertical blank queue.

This routine should examine the mouse coordinates, see if they have changed, and if so, do all the erasing/drawing neccessary to move the mouse sprite. (since the routine is called during vertical blanking, you can be sure you're drawing/erasing at the right time).

Somehow this reminds me of virus for PC's. This virus, as long as it is in
the system, mutates data written to the disc and de-mutates data read from
infected files.
This means that everything works fine, until the virus have been removed or
it removes itself.
I don't know why I thought of this virus... ;-)

I would not buy the virus, but some might buy datadiet. I think I would buy
another 100Mb (faster!) harddisc if I needed more space...

Whoops! I accidently emailed the following followup rather than posting it
(I've only been on the net 1 week... still haven't got the news reader
sus'd :-)
Here it is:

In article <1992Jan16.160722.15319@gumby.cc.wmich.edu> you write:
|> time that data is being received. (I'm talking here about librarian
|> type applications. If you're writing a continuous real-time application
|> like a sequencer, shutting the mouse off may not be an option, and the
|> custom interrupt handler approach is probably required.)

Sure is - only Shareware/PD and the cheapest and nastiest budget
sequencers use the TOS routines and they lose loads
of notes or else stop you using the mouse in record mode

|> It's not true that the 200 Hz system clock generates enough overhead to
|> cause data loss. I know, because Omni-Banker relies on periodic checks
|> of that clock to determine whether data dumps have timed out. I can
|> dump 15 kB from a Yamaha RX-17 drum machine at 325 uS per byte into
|> Omni-Banker without loss. What may be surprising is that I've left
|> the input buffer at it's default size of 128 bytes, and the data cap-
|> ture loop is written in OSS Pascal (with no assembly code). (I pull
|> the bytes out, examine them to see if they should be filtered out,
|> check for EOX terminators, check the timing, and stuff them into my
|> own buffers... all in real-time, all in Pascal).

I'm using UK TOS 1.62 and the 200Hz system clock *does* cause lost midi bytes.
The problem is marginal (less than one byte/minute at full midi bandwidth) so
you might not notice it in the 5s or so it take to transfer 15kb.
In priciple *any* MFP interupt routine can cause lost midi bytes if it hogs
the processor for more than about 300us but usually only the mouse and system
clock are enabled.

|> Another area that *might* result in data loss is if there are many
|> routines hung off the VBI chain. I don't know for sure about this,

...

|> However, the MIDI port is attached to the MFP chip, which is at a higher
|> priority level than the VBI, so input data would still be collected, un-
|> less a VBI routine was badly behaved and set the interrupt level up,
|> locking out the MIDI port (for >150-180 uS). Probably pretty safe, al-

|> though in a commercial application, I wouldn't want to risk it.

As you point out VBI routines run at a lower priority so they shouldn't
be a problem unless they take so much cpu time that your main routine
can't cope.
I do all my input processing (including storage allocation) in my interupt
routine so this problem never arises.

I had a similar problem with the old STHA ICD adapter. Newer
drives using the scsi2 commands don't seem to work with older host
adapters. I ended up buying the new ICD ADscsi board, which incidently
seems to be faster as well.
Appearantly, the BMS 200 works also. But ICD's 5.x software is
the best around so it's worth going with ICD.

While BGM partitions have large logical sectors, they still have 512 byte physical sectors. At least 2 sector editors that I've used (Supra and Atari) deal in physical sectors. I can see how this might make sector editing a file or a FAT entry even more confusing than it already is, but at least the editor doesn't choke.

Correct me if I'm wrong (and I am sure that someone will :-) but I was
under the impression that Beckemeyer Development's Hard Disk Sentry
handled BGM partitions. True or not? I currently keep my partitions
under 16Mb and use the Michtron Toolkit to de-fragment.

>Yes, I'm a de-fragger freak... I hate having a fragmented drive!

Hello, Chris.

There is a defragmenter of the Atari-Corporation, those guys, who wrote
the HDX-Software, and it works very well even on big partitons.
It is called CHKDSK3 and can be found via archie. If you can't ftp, just
email me and i'll send it to, you.

But the problems with the sector-editors remain... I use a very popular
programm here in germany, called SED440, which is really very good
(you can read harddisk even without any driver-programm...), but it also
has problems with by big partitions...

Read ya, Phil.

This is only true with TOS 1.0/1.2 and HDX formater, if you have TOS
1.4 and higher you can format 32 meg partions with 512 byte sectors,
but not with HDX, but is possible with Supra, and not to sure about ICD..

If you are talking about the USR modem, it comes from the factory
with flow control disabled.(Don't ask me why) You need to set the
appropriate registers (&H1,&R2) if you want the modem to notice
hardware flow control. Apologies if you already know this, Also,
there's a program called serptch for the TT which fixes some bugs
in serial port handling code, but I don't know what the bugs are.

252. 14400 baud modem problems

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-19 13:56:30 UTC
From: genius@sys6626.bison.mb.ca
Message-ID: <Vs1seB1w164w@sys6626.bison.mb.ca>
Source record: 46108

I recently purchased a 14400 bps modem for my TT030/4 and am experiencing a few problems. I am using TOS 3.01, STalker 3 and a 31k RS232 buffer (auto-folder program).

1.I can't get the RTS/CTS to work properly! When sending data from my computer, my computer will send to the modem at 19200 baud, and the modem, only operating at 14400 will send what it can, but when the modem's internal buffer fills and the modem drops the CTS, STalker 3 (or the TT, or whatever's to blame) keeps sending data. XON/XOFF seems to work ok, but I'd rather use RTS/CTS. If I set my modem to RTS/CTS and my STalker3 to RTS/CTS (as opposed to XON/XOFF), things really act weird. If after making those changes, I type in a command (say 'atdt8951234'), the modem will not respond. It will echo the characters back to my terminal, but after the carriage return sent by me, the modem will echo a c/r, but no linefeed and no 'OK' or 'ERROR' messages like it usually would. Then if I retype the line and hit return, the modem will respond like it's supposed to an dial the #. This only happens when typing in commands manually with the RTS/CTS set (ie, having to type commands twice). Using STalker's autodialer won't work...PERIOD, no matter how many times I try (strange). Even stranger, if I set the settings in STalker to BOTH RTS/CTS and XON/XOFF, then everything will work fine, but I will still get overflows and my terminal's failure to stop sending when the CTS is dropped. Who's to blame for this mess? The TT? STalker3? My modem? I'm CONFUSED! (and it's not the cable as I got a fully wired EXPENSIVE one thinking that might be the problem). Did Atari ever fix their RTS/CTS bugs from earlier TOS's? PS, I've already tried TurboCTS.prg...that just hangs the TT..weird.

2. Using XON/XOFF, I still have problems uploading (read: it won't upload!). STalker's sending data at 19200 baud, the modem's sending at 14400. With Zmodem, STalker will send about 10-15k then the modem will light up it's Transmit LED...then I'll get a message that says 'repositioning to byte 0'. Then the xfer will start all over again. Same thing will happen and maybe this time I'll get a 'repositioning to byte 2048'...essentially getting nowhere fast. Why does this occur? Y-modemG screws up too, but in a different way...STalker3 will send the entire file to modem, the modem will act as though it's keeping up exactly with the computer (ie, the TT finishes sending and the modem's Transmit led will turn off) then I'll get a message, 'transfer aborted'. Very strange...

ANY help would be GREEEEEEEEEATLY appreciated...

Well it was Pal B, but there are a few mods to do to the Modulator,
but it did work very well..

256. Re: Reliable midi input

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-19 18:34:02 UTC
From: shenson@isis.cs.du.edu
Message-ID: <1992Jan19.183402.1637@mnemosyne.cs.du.edu>
Source record: 46109

I've been reading the midi discussion (dropped characters) with
some interest. I threw together a couple of ST's a while back , one
stuffing out characters as quickly as possible , the other reading and
noting dropped characters. The ST doing the reading was a TOS 1.60 STE.
With mouse enabled moved as quickly as I could move it nothing
was dropped , great I thought. Clicking mouse buttons and pressing keys
on the keyboard caused *lots* of dropped characters. I then went through
some of the level 6 interrupts seeing what could be done. After much messing
around I added something that made the 200Hz interrupt interruptible and
something which prevented this when the GEM timer routine was called by it
(etv_timer I think) . Anyway what appears to happen is that characters aren't
dropped anymore. Just for fun I swapped the ST's round and had a much older
STM (with a pre-1.2 TOS) doing the reading , to my surprise the result was the
same.
So what I'd like to know is whats all this about mouse movement causing
trouble ? Is this a tos version specific problem or does it appear when the
mouse is interacting with menus etc (something I didn't check) ?
(Note : I did do all sorts of other things , like checking the BIOS was quick
enough etc, which it is , just , and finding out that the GEM routines change
the stack and don't like being interrupted).
(Please reply by email if possible)

|> dmb@wam.umd.edu

Actually, very few computers (besides the Atari ST) meet criteria #1. If anyone thinks that Windows, the Macintosh, OR most varieties of Unix with Graphical User Interfaces is fast in ANY sense of the word (except that they need to be run on minicomputer-level CPUs to run acceptably decent), then tell me who they are so I can sell them a couple of S&L's....

I think its the same order the accessories register with the aes menu_register call. And that depends on the sequence the accessories are started and how much aes calls they do until they call menu_register.

260. Re: Partition sizes on HardDisks

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-19 22:32:37 UTC
From: healy@cod.NOSC.MIL
Message-ID: <3591@cod.NOSC.MIL>
Source record: 46112

I also have a hard disk question (hopefully not a FAQ).

I have a 1986 vintage SH204 (20 Mb). I was given a 40 Mb Seagate ST521 for free, so I swapped out the original drive (a Tandon TM 262) and put in the Seagate.

Now here's the problem:

I have the Supra utilities. Using the SUPFMT program I created a drive type to match the ST521 (6 heads, 820 cylinders, reduced write at cylinder 820, no write precomp, landing zone at cylinder 819 [have also tried 4]) and a controller type (17 sectors per track, 1:1 interleave, step pulse rate of 2, no reserved tracks, no mapping of bad sectors, no removable media, no fixed partitions).

I have set up the partitions in various ways, 5Mb, 7Mb, 16Mb, 12Mb. I also tried 4 10Mb partitions with no different results.

At any rate, when I format it, the disk chugs along and everything seems to go ok. When the computer resets, it doesn't recognize the C,D,E and F drives and there is no data in logical sector 0 when I use the SUPEDT editor. If I set the drive specs then I see the correct data using the sector editor. If I exit the program and rerun it, the data is no longer there.

What I think is happening is that data isn't actually getting written to the disk, perhaps due to some incompatibility between the controller and the drive.

The SH204 has an Atari host adapter, rev C. I am not sure what type of controller I have. Does anyone have any ideas and/or suggestions? I really need the extra disk space and (like everyone) need to minimize the cost (so I would like to get the equipment I have on hand to work). Thanks.

I'd go for ICD software, it does a much better job, and would likely
have your drive in the specs.

There's a problem with the host adaptor, at least I know there is with
the Rev. B, which is what I had. I did the same thing, except I upgraded to
a Seagate 84meg (SN296 or something...) There's a PAL chip in the controller
that has a bug. You can get something called the ADE chip from Berkeley
Microsystems. It's $20 or so, and my drive has worked beautifully since I put
it in. You might also consider getting an ICD host adapter, the simple model
runs for $50 and will do wonders for your drive (not to mention the software
is quite nice.)

From: ksommerville@cix.compulink.co.uk
Message-ID: <1992Jan20.011538.232@demon.co.uk>
Source record: 46116

My experience in this area is as follows:
If you connect your modem to Serial Port 1 (default) then RTS/CTS doesnt work- its ST compatibl B-)
Connect it to Port 2 and change the appropriate settings in the CPX so that 2 is the active port and RTS is ENABLED. Dont touch XON/OFF.
If you do this then RTS definately works

263. Re: VT100

I am not sure about a straight DEC vt100, but if using a PROFS keypad configuration, which usually means you're talking to an IBM mainframe running VM/CMS, PF11 is ESC O R as the transmitted sequence.

Try moving files by holding down the control key and selecting some files
in a desktop window. Once the files are selected drag these to another window
or drive icon, while still holding down the control key. After releasing the
mouse button, the selected files are moved to the location you pointed to (
another folder, drive etc.)

A handy feature.

Geert.

|> using this machine.
|>
|> Thank you in advance.

Sorry Hanson, but MONOCHROM is not always the same.
The pin you probably connected is the ST-MONO signal.
Why you don't get a picture.
1) this signal is only active, if wired like in the ATARI SM124/144
(I think a pull-up or pull-down resistor)
2) if this connection is made, you get a 72Hz signal neither your TV nor your
Monitor will accept.

Hint: If your TV has a SCART connector you can get ST-LOW and ST-MED in color.

Bye, Ewald

I have checked out tcsh and it seems to work largely OK. There's a couple of features which I have to work round: the login.csh supplied refers to a termcap entry which I don't have and hence the cursor goes away after certain applications and my transfer of profile.ksh to tcsh.rc isn't totally successful, I'm getting error messages back about environment variables not starting with alpha characters. Apart from that, it seems fine.

Does anybody known anything about the relocation that that tos does
when locating a program. I am tring to track down the address of
a certain symbol when a program is loaded.

I known the value of the symbol in the symbol table and the load address
of the program, I had assumed that load address plus symbol table
offset would equal the execuation address, however it does'nt see to work
that way.

There seems to be some magic number addeed to a symbol address does anybody
have any clues ?

If it helps I am using lattice C 5.0 from Hisoft

> experiencing any problems?
>
>Thanks,
>Scott Willingham // willing@icsl.ucla.edu

To follow up on my own post, I have found something of interest. Several of the problems I have experienced with tcsh seem to be related to my having set the 'fast-bit' in its executable. Additionally, programs such as the ls.ttp in the gnu fileutils package cause problems when their fastbit is set. Consequently, I have unset the fastbits in all of the executables on my system and things seem much more stable.

I am using MiNT 0.92 on a 2.5MB 520stfm with TOS 1.2. Perhaps there is a bug in MiNT or mntlib's handling of the fastbit and heap/stack. Does anyone have any ideas on what's up?

-- Scott Willingham // willing@icsl.ucla.edu

PS: Tcsh still bombs when I try to run it from bgacc.acc.

276. St Ram and Tos

Further to a previous post I would like some info on NZ availability of new Tos's and ram upgrades, I upgraded my 520st to 1meg with a few chips and a soldering iron, but now find I need more, I could chicken out and get a cheap ste and some simms but like a challenge altogether too much! Before I start tracing tracks on my st motherboard I need to know if any further address decoding is neccesary, ie are all address lines available directly from the Glue chip, including chip select etc???
Thanking in advance

PS. If anyone wants to upgrade their 520 to a meg, you would be surprised how easy it is in most machines, $45 in parts and a bit of soldering and Bobs your Aunties Live in Lover....(Think about it!) anyway, if ya want info, e-mail me or sum'it

Yes, it's called Ghostscript, is part of the GNU free-software project, and is available on atari.archive.umich.edu... It works fairly well, and has drivers for the ST screen, 9 and 24-pin printers, as well as for the HP DeskJet and Laserjet (if I remember correctly).

Bernd,

I use the LQ570 printer with my Atari 8 bit, and it is not nor is the other LQ printers post script. Esc/P2 is something different. Sure, it offers scalable fonts in Roman and San Serif, but it is by no means post script. If you have wordperfect for the ST, perhaps the IBM wordperfect driver that came on the floppy disk will work?

Source record: 46131

I'm almost about to decide to buy a TT but was wondering about
one of it's technical aspects...

What are the top baud rates of the two RS-232 ports? Can one
of them handle speeds of 56,000 bps? For example, will there
be terminal programs for the TT that can have a "56,000bps"
button (to click on, for example) like the ST's have a
19,200 bps max. (usually).

And, what do the 2 serial ports have to do with the VME bus?
Do they take up one of the "slots"? (or is that when you
want 4 serial ports... :-)

P.s.: One thing that would help me get a TT is if I could
sell my 520ST. Anybody who is going from TOS 1.4 to
2.06 that wants to sell their ROMs, send me e-mail.

DRI .o files are identical with those of CPM/68K, or more precisely those
of Alcyon C, which in turn is very close to unix V7 format. Just read the
aout.h file or the compiler documentation. GNU C has nothing peculiar: it
just generates standard unix files `a la BSD4.2. The major difference
between these is the presence of the 'string' in the latter that accommodates
arbitrarily long identifiers.

```
The changes to TOS1.4 are as follows:
Copy/Delete/Move functions can be interrupted with UNDO.
You can autorun GEM programs using install.
Various desktop dialogue box changes
When a directory is on screen, esc now does a re-read every time instead
of when it thought the disk had been changed.
You can no longer enter invalid filenames on the desktop.
When printing a file, the keyboard is checked every 16 secs for q,Q,^c * UNDO.-

Time/Date preserved across copy/move operations
True msdos formatting of floppies.
New file selector.
40 Folder bug sort of fixed, now more like a 100 folder bug!
OS pool reduced and memory handling improved.
Fast load via setting the Fastload bit of directory. Quicker program startup
due to less memory initialisation.
Alt/Ctrl/Delete causes warm boot.
Alt/Ctrl/Delete/Right shift causes cold boot.
Improved keyboard repeating.

2 new bugs
RTS/CTS flow control bad
Shel_find() - bug causing random inability to find certain filename.
Both fixed by TOS14FIX.PRG

Maybe I'm being a bit optimistic here, but shouldn't Atari fix this in new ROMs? (And provide a TSR patch for old ROMs?). Steinberg et al have proved that the problem is fixable in software. As the MIDI ports have provided a significant selling advantage for STs, it would be nice if they actually worked properly! (I guess we're stuck with the non-standard port wiring, or has anyone got a TSR to fix that :-)

|> Does anyone know whether it is possible to read Hyperformatted
|> disk on a PC. The problem isn't DOS (PC-speed works fine with
|> these disks), so what is the problem?

You're right, it's not a DOS problem. You can even add lines
like "device=driver.sys /d:1 /t:80 /s:11" to your config.sys and
it will work on an emulator on ST's. Maybe up to 10 sectors this
also works on "normal" PC's, but definitely not with 11-sector-disks,
because the standard PC floppy controller is unable to read/write 11
sectors on a DD disk.
And it also doesn't work on a HD-drive, because the data on such
a drive is written in half the physical space than on an DD drive
thus making more space for up to 20 (hyper-ST 21) sektors per track.
You can of cource format a HD disk with 11 sectors, but then it's
only half filled, the other half of the track is empty. Since this
is physically different (allthough it's logically the same) a HD floppy
controller in a PC is definitely not able to read this disk and will
never be, unless you manipulate the controller.

TeSche

P.S. 80 tracks * 2 sides * 21 sectors * 512 Bytes = 1.7 MegBytes
where is DOS with its 1.44 Megs ???????

287. VORTEX ATonce 386SX for MSTE's

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-21 16:41:40 UTC
From: itschere@techfak.uni-bielefeld.de
Message-ID: <1992Jan21.164140.143@unibi.uni-bielefeld.de>
Source record: 45991
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi there,

according to the numerous postings about PC emulations on Ataris,
I'd like to tell everybody who's interested some facts about the

VORTEX - ATonce 386SX

It's true that it exists, cause I own one. But it's only for use
with the MEGA-ST/E, since it is plugged in the PLCC socket of the
68000, and all of the other Ataris have DIP CPU's. Perhaps there is
something like an adaptor on the market, but I don't know.

Some facts :

- 32 bit CPU 80C386SX-16MHz
- optional 80C387SX-16 coprocessor
- optional 512Kb fast-ram
- uses internal MSTE-cache
- can use DD and HD floppy drives (theoretically)

Some data :

- Several graphic emulations like
when using a color or monochrome monitor
CGA - 640*200 (2)
320*200 (4)
when using monochrome monitor
HGC - 720*348 (2)
OLI - 640*400 (2)
EGA - 640*350 (2)
VGA - 640*480 (2)
- in the last two resolutions you can only have 640KB of base memory, all
the others can provide 704K base memory
- emulates serial mouse on com1: or com2:
- emulates centronics printer on lpt1:
- every ram above 1 meg is used as extended memory

There may be several thing said, but I'd only like to say a few
important facts. The graphic emulation is of cource the biggest
disadvantage. The EGAmono and Olivetti modes can simply not be
detected. If you try driver=detect in turbo for example, CGA is
reported. But if you ignore this report, it works well. Sadly, most
programs check the hardware before using it, so some programs refuse
to run. The VGAmono solution works correctly as MCGA 640*480 (2) mode
and can be used. Windows 3.0 runs not only in protected (standard) mode,
but also in extended 386 mode including virtual memory and things like

there. The performance is due to the original MSTE-harddisk not so fast, but bearable.

Some performance information:

without with FastRam

Norton SI4.5 12.3 15.7
PCTools 4.2 330% 510%

Now what is FastRam? Well, since the MSTE works as a 8MHz system, but the CPU runs with 16MHZ, it had to be slowed down (waitstates etc.). The Atonce 386SX uses the internal MSTE-cache and is therefore faster than other emulators on ST's. You can buy the additional fastram, which can be fitted in four sockets on the emulator and then completely replaces the lowest 512KBytes of memory, thus making the whole system another bit more faster. I think this is the absolute maximun in emulation performance for ST's that is and will be.

The prices:

Vortex Atonce 386SX : ca. 700 DM = 450 US$

The additinal FastRam needn't be bought at Vortex, since standard chips 4*256Kbit-70ns are used and costs about 50 DM = 30 US$.

The complete ST-ram can be used as extended memory. It is said that you can also configure it as expanded memory and there is a driver included, but this is not LIM4.0 compatible and therefore not widely accepted by programs. It'd like to say that the expanded memory doesn't work, but when using windows for example, that's not necessary.

The whole hardware is emulated quite good. It's funny to see several diagnostic programs reporting all these AT-chips working correctly, and knowing they're not even present.

I'm sorry, but I can't exactly remember the adress, but I've seen it was already posted in the last days, so have a look in magazines or other postings. It goes somehow like this:

Vortex
Computersysteme GmbH
Falterstrasse X
D-W 7102 or 7201 or X Flein

The W is neccessary for foreign writers, cause since the reunification there are some doubled zip-codes. Forgetting this will not end up in a bit error, but surely delay letters for some more days (and the german post office is really not one of the fastest nowadays).

Anyone who wants to know more or has special questions, is invited to send e-mail to the following adress:

itschere@techfak.uni-bielefeld.de

Hope, this has helped some guys...

Actually, there is a PC shareware program, called Maxi16, that allows you to write up to 1.6 meg on hd 3.5" disks, 1.4 meg on 1.2 meg floppys, 420k on 360k floppies... all numbers rounded... of course, you need to have the program on both computers, and I think it operates as a memory-resident program.

Maybe getting this program would help?

290. How do Cconis() and Crawcin() work together (in MWC)?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-22 02:04:10 UTC
From: flinn@cs.ubc.ca
Message-ID: <1992Jan22.020410.13023@cs.ubc.ca>
Source record: 45993
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I need to obtain keystrokes from standard input as they become available, and not have them echoed to standard output. I do not require redirection of input. After some experimentation, it seems that Crawcin() is the best way to obtain keyboard input that potentially needs to be buffered (i.e. I can't guarantee to execute the key press function while the key is actually physically depressed). But I require non blocking input, so I have used Cconis() to determine if a key is actually available. The acual code is:

```
/*
* This function will return -1 if no key is available, or the key
* that was pressed by the user. It is checking stdin, without blocking.
*/

int key_pressed()

{
if ( Cconis() == -1 )
{
return( (int)( Crawcin() & 0xffff ) );
}

return( -1 );
}
```

The problem is that the Cconis() condition does not become true until long after the program starts and many keys have been firmly pressed. After it behaves correctly once, it continues to behave correctly, but the first keystrokes (for which Cconis() did not return -1) are lost.

I'm a novice with this sort of I/O ... am I doing something that is obviously wrong? I am using MWC version 2.1.7.

Thanks in advance,

291. Broken ATARI 520STFM internal power supply

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-22 02:46:30 UTC
From: corey@sdf.lonestar.org
Message-ID: <1992Jan22.024630.14407@sdf.lonestar.org>
Source record: 45996

Greetings, ST World.

I have a problem with my ST's power supply. A long time ago I was screwing around with my voltmeter in the ST and lo and behold, I shorted out the supply! This happened in about '89. Since then, I have been running off of an external power supply that I got at a fleamarket sale, which works fine.

However, I want to fix the supply I have now. I have been taking Electronics classes at a local community college, and one of my teachers has been helping me see if I can fix the power supply.

First of all, here are the specs on the power supply:

The Power supply is from a 520STFM computer, which was upgraded to one Megabyte of memory (by myself.) The power supply is internal, and is apparently a switching-power supply type. There is a little sticker on the power supply that says "OUT: +5V @ 3A, +12V @ 1.6A"

Unloaded, the power supply puts out +5V and +11V.

Loaded, the power supply's +5V becomes +4.5V (at HALF-load..1.67A), and the +12V becomes something like +10.6V. Obviously these parameters are unacceptable. The +5V regulation is AWFUL. TTL chips need of course from +4.75V to +5.25V to operate within specs...+4.5 just don't cut it!

We think that the power supply is a 'switching' power supply. The way my teacher explained it to me was thus: The 120V operates a square-wave oscillator which operates at a higher frequency than 60Hz (we measured it to be 100Khz. After I resoldered some connections, it went to 57Khz!). This higher frequency allows a smaller transformer to be used to step down the voltage. Thus a smaller power supply is made, which can be put inside a computer like the ST. Then this waveform is rectified and filtered, and perhaps series regulated. There are NO 7805 or 7812 regulators in the circuit!

My teacher says that the higher the freqency of the oscillator, the higher the output voltage. Initially, the circuit ran at approximately 100Khz. After some noodling, the frequency dropped to 57Khz, and sure enough, the voltage went down some. Curt (teacher) says this is how the regulation is acheived. He also says there is some feedback mechanism that helps the regulation out. We are trying to find the resistor which controlls the oscillating frequency, in the hopes of being able to put a potentiometer in its place, so we can finetune the output voltage. Does anyone know which resistor this is, or if it exists??!

Also we are checking the solder connections. Lots of the connections looked 'cold' or bad. So I am redoing many of them. Also, we are going to

check the capacitors to see if they are bad or not. Then we may have to start pulling out the transistors to see if they are OK. Our school has lots of goodies to check this stuff with.

What I want primarily is a SCHEMATIC to this darn thing! Is there any way for me to get one? Would Atari not give one to me (a humble hardware hacker) because I'm not a licenced technician?!?? Please help.

Also, any suggestions as to the problem would be greatly appreciated. Email your responses to me, and if I get the thing fixed, I will summarize what happened here.

Thank you.

Ah, but is it? I formatted a disk using TOS1.4 a few days ago and copied a file on to it. I then ran Spectre, started up Apple File Exchange and inserted my new disk. Apple File Exchange did not recognise the format but did offer to re-format it as an MS-DOS disk for me, which it did successfully.

So, which is wrong: TOS 1.4 formatting or Apple File Exchange? I would bet on the former.

294. Kermit Help

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-22 11:46:17 UTC
From: Roger.Sheppard@actrix.gen.nz
Message-ID: <1992Jan22.114617.18150@actrix.gen.nz>
Source record: 45997

Well we have a new system here that run on a Vax/VMS, but the problem
is that we can only use Kermit for getting files..

The Big problem is I have never used Kermit in my life, and all the other
Atari chaps here have never used it, they seem to think its a bag of worms.

The Kermit that I have is the German ACC one that was posted in binaries
late last year, I also use Flash..

The prompt that I get from the Vax is C-Kermit..
there is some help from the system but is not that help full..

So any help would be most appreciated, also the VT 200 string for a F10 key
would also go down well..

Also thanks to those that sent me info on VT100 and the string for a F11
key, that one now works ok..!!

In principle the DOS Computers are able to read the Atari format, but due to the 'laziness' there are mostly no questions if the disk is not in the 'standard' format. Therefore, even though Atari writes the information to the Bootsector, the DOS comps don't read them, but just assumes it's in the 'standard' format.

ERGO: DOS says NO WAY.......

...But who wants to use DOS Computers anyway ????

My guess is that the NEC derived controller in the PC can't handle
inter-record gaps as short as they use to get 11 sectors on. The
177x chip used in the ST obviously can. This has bit me before.

>PS: Tcsh still bombs when I try to run it from bgacc.acc.

Just a further note. Even with the above changes I still get problems.
After a while using tcsh, I get 'out of memory' errors and symbolic links
on the unified file system also come unglued. I suspect that tcsh screws
up in its memory management and also assumes certain allocated regions to
be filled with zeros. Somehow, memory is being corrupted.

Oh, well... I'm glad it works for the rest of you (but you might want to
be wary).

> The fastbit setting only works on >1.4, so use pinhead instead. I
>had heard that the fastbit was completely ignored prioor to 1.4, so
>the problem might be in MiNT.

Huh? The only way the fast-load bit can affect a program is that if it's set, the heap (space after the BSS) isn't cleared. Thus if the program expects it to be clear (i.e. it expects memory obtained from malloc or Malloc to be clear) then it will WORK if the fast-load bit is clear, or if the version of TOS doesn't have it, but will NOT work if the bit is set and the TOS version has it.

Many GNU tools suffer from this. GCC-LD does -- I've found & reported the bug, but I don't know if it's fixed. I never set the fast-load bit of my GCC executables.

So if it works when you clear the bit, and doesn't work when you set it, that smells like the problem. But if it's the other way around, that's really odd and unexpected.

>>set the 'fast-bit' in its executable.

I guess I missed Scott's original post, but it's not surprising that
tcsh doesn't like the fast bit -- tcsh relies quite heavily on the
semantics of the sbrk() function being exactly the same as under Unix,
and I think this includes the memory having to be initially zeroed
(or at least, it's quite possible that tcsh assumes this). Thanks for
pointing this out -- I'll have to put a note about it in the tcsh docs.

> The fastbit setting only works on >1.4, so use pinhead instead. I
> had heard that the fastbit was completely ignored prioor to 1.4, so
> the problem might be in MiNT.

Ummm, the problem was that the fast bit was *working*, i.e. not clearing
the memory that tcsh expected would be cleared. The same thing will happen
if you use pinhead.

Incidentally, MiNT does implement the fastload bit regardless of what
version of TOS it's running under, and so far as I know it does it
correctly (i.e. I've set the fastload bit on all kinds of programs
on my system, and none of them crash without explanation).

Source record: 45945

The network port (which also is the same as one of the serial ports on the tt, you use one or the other. I believe electricly they are the same.) is capable of somewhere over 200k a second... (200,000+ baud as well as many below that too..) As to programs to use them? Maybe some of the newest stuff..

As to the ports on the VME slot cover, they are on the cover only, they do not take up the slot. If you want to use the slot you need to provide another place for the ports. A poor design feature I agree.

Ok, the old forty folder bug casued the machine to crash and sometimes erase disk stuff in the process. Mainly this was due to TOS's keeping track of too much and not eliminating old records.

Now, what is the new problem. And what is the best solution. Run FLDR100 anyways?

Yes, I realize that the fastbit only works with TOS 1.4 and above.
However, MiNT does support it and I wouldn't be tempted to use tcsh at
all without MiNT. And I do use pinhead (to speed bootup, primarily).

I believe that the problem is in tcsh -- somewhere. (I don't have the source)

Hmmm.. The MIDI port is a 20ma current loop, i.e. two bits of wire (plus screen) so I'm not sure what you mean by `hooking up a 25pin serial cable'. If nothing else, you'll be pushed for room :-) Certainly, MIDI is a serial port, but I'm not sure how you might use it for comms, i.e. a modem.

You might want to check out the ARP book in the /languages sub-directory at atari.archive. It might bridge the gap between plain ol' 68000 and ST-specific stuff. You could also get the gas assembler from /gnustuff. I'm not sure, though, what it's like to use on its own -- it's more usually used (by me) as the back-end to gcc.

Cheers,

The best PD assembler is probably Devpac version 1.0 from Hisoft. Since Devpac is currently up to version 2.something, they decided to release 1.0 as PD, nice aren't they ? It appeared on an ST Format coverdisk once, and you can probably get it from atari.archive.

Andy.

>So, which is wrong: TOS 1.4 formatting or Apple File Exchange? I would bet
>on the former.

Both, I think!

TOS 1.4, whatever anyone may claim, does not seem to format floppies in
exactly DOS format. I formatted a few the other day, tried to read them on
the file transfer PC here, and failed miserably. It just didn't work.

I've found that the best way to get a PC to read ST disks is to either

1) Use DC Format to put a DOS boot sector on the disk; or
2) Format the disk on the PC

However, even when I use the DC Format route, Apple File Exchange _still_
won't read the disk. It appears to be extremely fussy -- so the best
solution is therefore to

3) Format the disk using Apple File Exchange.

Then it works...

>anyways?

There will always be some sort of folder limit in TOS, because it only has a
finite amount of memory available! In TOS 1.4, you have to try _really_ hard
to come up against the folder limit, because the OS pool memory is managed
properly. If you do hit the limit, your ST will stop and display a message
telling you to use FOLDR100.PRG. You then have to reset.

I use my ST for everything from heavy-duty wordprocessing and DTP to
advanced programming, and I have a 48MB hard disk with 5 partitions. I use
TOS 1.4 and I've never run out of folders yet.

So, my advice is not to use FOLDR100.PRG unless you find that you have to.

My only problem with tcsh right now is that using the port of Emacs 18.57, I get an address error (PC=0) whenever I "C-x C-f" or "C-x i" or "M-x load-file". They work fine if I use mintshel (formerly init.prg) though. I don't know where the problem is. Has anyone else had this problem?

TOS can still run out of system memory, but there are two big
differences with TOS 1.4: (1) It manages its internal memory better,
so you are less likely to run out. (2) If you do run out, you are
politely informed of that fact and forced to reboot, but your files
will be okay. If this happens frequently, you can use FOLRDXXX.PRG to
increase the size of system memory.

Just to add some fuel to the fire I thought I let you in on some rather more interesting happenings in this DOS format problem. I don't know if TOS 1.4 is DOS format compatible, or if the APPLE Exchange program is, or if DC format is. Then again I'm not exactly convinced the DOS machines I use know what DOS format is.

In the Lab I work in we have:

- True IBMs
- IBM clones
- SUN workstations
- My Atari on occasion
- Macintosh IIci's
- Apricot IBM clones

All these machines profess to use DOS format. Not one of them will format a disk that is readable/recognized as a DOS disk on all the others.
Some of them will use a disk formatted on another machine at one time and not the next. The SUN's will on occasion read a DOS disk when it has been told it is a UNIX floppy (discovered quite by accident by a new user!!).

The end result of all this confusion is that nobody really knows what DOS format is!!!! So I suggest we not worry about having TRUE DOS format as I doubt it exists!!!

Have a nice day everyone,

Rob

Bus mice are a cinch, serial mice are not (unless you can rip out the serial hardware and make it a bus mouse). The file describing this should be on atari.archive (msmouse.txt or something). If you cannot find it, email me and I can send you a copy.

True. Something about a second FAT table. Try the program ps2form from atari.archive. I have been using it for years, and it has yet to fail.

By the way, I could not get any disks to work on PC's for a long time because I had the Key virus all over my disk collection (it would overwrite the DOS bootsector right after it was written). That incident put me in the habit of running VKiller on all new PD disks I buy (and I occasionally find a virus, too). This program is great, get a copy if you don't have one already. The newest version is 3.84.

Part of the problem is that real IBM machines will format a DD 3.5"
diskette as HD if you don't provide switches. This disk is unusable on
most clones since they don't see the HD hole and see it as improperly
formatted. The same goes for using this disk on a Macintosh for Apple
File Exchange.

Message-ID: <1992Jan24.024534.3249@actrix.gen.nz>
Source record: 46027

Well thanks to all of you that help me with Kermit, but I have bean forced
to use Uniterm, no other Kermits out there..

Here are some Uniterm problems that I encountered..

1. How do you get out of a dial when bussy, my dial is set for 99 retries..

2. How do I get to the capture buffer and can I use the data there
for uploads, and can it be marked for saving..

3. Can someone explain what this means, Note: I used the DO option in
Flash to Log me onto a BBS, and I would like to do the same with Uniterm..

Cut from Uniterm Manual..

```
------------------------------------------------------------------------
A tip for people that want the macro to handle waiting for the
`CONNECT' or whatever it may be message, just leave out the
`Connect msg' entry,
The dialer will then immediatly start executing the macro file after
sending the number string..
------------------------------------------------------------------------
```

...

Antics FLASH..!!

The Flash option that Antic once sold for Flash, is this used
inconjunction with Flash or as a stand alown program, if its used
with Flash and does work can any one tell me if I can still bye it..

Thanks..

```

Not true. There is a public domain port of Kermit (from the PC world) that works just fine on my ST. I believe that I got if off of GEnie. I shell out of Flash 1.6 with the GEM command directly to this GEM version of Kermit. The only "problem" with it is that send & receive packet lengths are limited to 99 bytes in size. However, it still works great with the VAX/VMS Kermit (that someone here got off the DECCUS tapes, I think) as long as I set the packet lengths to agree.

I would offer to send it to you, but I don't know how. (You can probably tell that usenet / Unix is not my primary environment from the lack of a .sig file. I am VAX/VMS resident. :-) :-)

Regards,
Roy C. Gosewehr

Try using the ST program ibmfmt. Apple File Exchange is happy with these,
and it does seem to be very picky as to what it accepts (rather than reading
the bootsector to check the format, as it should).

I use this regularly, to prepare disks with postscript files
to be printed from a Mac.

>... no other Kermits out there..

this is not true. there are several versions of kermit for the st,
including a C-Kermit port (i have an executable, but no source).
i usually use uniterm, but i remember the C-Kermit port to be pretty
good. it should be at atari.archive. if not, i can mail the binary.
it is at least a year old but still reasonable (ie handles large packets,
etc). C-Kermit is the "standard" kermit supported by columbia univ. it
has been ported to a zillion platforms. the source is available via FTP
from columbia (i don't have the net address handy but can find it).

334. Re: Replacing LS logic parts between MMU and DRAM

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-24 20:49:43 UTC
From: rossin@hpfctgr.fc.hp.com
Message-ID: <35730004@hpfctgr.fc.hp.com>
Source record: 45960

/ hpfctgr:comp.sys.atari.st.tech / jmack@b11.ingr.com (Cery McCormick) / 4:47 pm Jan 9, 1992 /

I had heard on the net once of someone replacing the LS logic parts (74LS244 and 74LS373) with F speed parts. Could someone please tell me why this was done and/or what problem it fixed?

The F parts are a boat load faster. The 74LS244 maximum propagation delay is 18ns (0 to 70 degrees C) while the 74F244 has a spec of 6.5ns. This is about 3 times faster. This will help solve problems associated with marginal timing of the DRAMS but may cause other problems. The 74LS244 parts have hysteresis which will help remove the glitches often found in unterminated buses like those found in the ST. Also, the 74LS244 parts do not have as much drive and sink current as the 74F244 parts. What does all this mean?

1. The F parts will allow you to use slower RAMs and still meet the timing specs that the ST requires. This is good.

2. The F parts will not tolerate glitches as well as the LS parts do. This is bad.

3. The F parts can drive higher capactance loads than the LS parts can. This is good.

4. Since the address and data lines are not terminated the extra drive of the F parts can cause excessive ringing on the buses. The low current drive of the LS parts acts as series damping resistance while the high drive of the F parts acts like no damping. This is bad.

5. I've used F parts to drive and recieve 32-bit data over 3 feet of PC board and interconnects at 25 MHz with no trouble at all from -20C to 65C. This is good.

6. The F parts take more supply current. But not anything to worry about since there is only 4 parts involed (I believe there is only 4). This is a who cares.

The bottom line. It's only 4 parts and they cost less than 2 bucks in quantities of 1. Try it out. If it fixes your problem call up Signetics and tell them you like their parts. If it does not fix your problem there is always the ABT family (faster than F). Just stay away from AS parts. They are just too harsh (Transmission line death!) for bus interfacing.

Bye.

Ted Rossin (Had your hands on a 76 MIPS, 22 MFLOP 730 yet?).

335. JRD's port of GNU Emacs

Newsgroup: comp.sys.atari.st.tech

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'm using John Dunning's port of GNU Emacs and like it alot except for one annoying problem. Can anyone help me:

Get the file loader to stop stripping out Ctl-M's (cr's) from my ST text files? It's a real pain to have to replace all LF's with CR/LF pairs everytime I go to save, and GNU Emacs on my Unix box has no trouble preserving 'hard' CR's, so why should the ST version?

Similarly, how would I go about creating a mode (or defining the key) so pressing enter caused CR and LF to be inserted?

(Bonus Question): What is the name of the .el file (and where does it live) that I can put startup commands into? On my Unix box here it's ".emacs" but that obviously won't work on the ST.

> know what DOS format is.
>

Well there maybe a simple way of doing this.. Format a disk in the IBM like
this .. FORMAT A: /S so you get a System diskette (IBM system). Now try it
on all those machines in your lab.. Now format a disk on your Atari (your
TOS 1.4). Get out your favorate sector editor (DLII) can copy the IBM
systems disketts BOOT sector on to the Atari one. Now try it you maybe
suprised. I found Apple exchange wanted a ibm system disk so I uses
DC_FORMAT as a IBM boot(system)disk and have had _no_ problems over the
years.

Just food for thought, but when it comes to hardware there is no logic.

Roger there is a few "Kermit" emulators here on STaTus BBS, and two of them work with Flash, and the other from memory is for Interlink and masterlink.

One is an acc that works well I used it here with the old system 38 when the bank had in conjunction with pc_support, but it will not capture anything (mind you FLASH does not either when in upload/dload modes), and it works well with flash, just click and go..

That program is a bit of a joke, the max speed at 2400 was 38 cps, and
no one uses 90 byte packets any more, even the chap that wrote the
doc's for that program stated that it was slow.. 110 cps at 9600..

Please does any one know were I can get the Kermit program that was
sold by Antic for Flash..???

No, a 386SX is a 32 bit cpu with a 16 bit data bus - like the 68000.
A 386DX is a 32 bit cpu with a 32 bit data bus - like a 68020/030.

Hi Eric !
I don't know if you really want the virtual disk for the root device.
It's quite simple to recompile the Kernel, so that your root device is
i.e. on /dev/hd3 and there's no need for a virtual disk. You'll get more
memory for Applications and the loss of performance is acceptable.
Just change the line '#define DROOTDEV (DEV_RAM + 0)' into
'#define DROOTDEV (DEV_HD0 + 3)' in 'include/minix/boot.h' and start
the compiler. As a result you should get a new minix.img which now uses
/dev/hd3 as the root device.

greetings Theo

348. Help Formatting Floppies for DOS

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-25 17:52:04 UTC
From: somsky@brl.mil
Message-ID: <18053@smoke.brl.mil>
Source record: 45952

Perhaps someone can give me a hand here. I'm unfortunately still 'living' on a 1040ST TOS1.0 Floppy-only system, trying to keep it limping along until I decide what I want for a new machine (and can collect the $$$ to get one), and am trying to write some small, no-frills, cli-based (no GEM) tools to let me do just exactly what I want without a lot of extra features that I won't use. What I'd like to create now is a floppy formatter w DOS boot-block.

Now, I've got the (original?) ST Software Developer's kit (Oct '86), and I believe that's got all the info I need for formatting a floppy (A Hitchhiker's Guide to the BIOS, 1985 -- "Formatting a Floppy Disk"; with flopfmt(), protobt(), and flopwr()), but I havn't tried it yet. Since I want to be able to use these disks to carry files to and from work (where I've got an IBM RS/6000 that'll read and write DOS-disks), I also need the info on what needs to be in a DOS boot-sector. So, my questions become:

1) Is the floppy formatting procedure truely as simple as shown in 'The Guide', or are there some hidden 'gotcha's?

2) The 'standard' track/sector/interleave values are listed, but are there any variations that useful, or are variations just plain dangerous?

3) Are there any clean and simple ways to check-for and lock-out bad/marginal sectors?

4) My understanding is that to make a DOS-readable disk, you just have to put a "DOS boot-sector" on the disk. Is this in fact right? Do you just use such a sector in protobt/flopwr-ing the disk? And just what ARE the contents needed in this sector?

5) How do I create a volume label for the disk? I believe it's just a variant entry in the directory table, but how do you put it there?

6) I'm going to be using the Sozobon compiler for this. Any known gotcha's there?

7) (A bit more extended.) Does anyone have a concise description of just what the layout of a disk is (contents/layout of FAT's directories, etc.)?

Now I know that much of this has been done before and is readily available in free/shareware formatters, but again, I'm trying to create small, only-what-I-want, do-it-my-way tools.

Any help you could give would be quite helpful :-).
Please reply via e-mail. Thanks.

I speak for no-one other than myself --- sometimes, not even that...

William R. Somsky somsky@brl.mil

349. Various ST topics

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-25 19:53:51 UTC
From: ec333way@sail.uwaterloo.ca
Message-ID: <1992Jan25.195351.26589@watserv1.waterloo.edu>
Source record: 46023
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I was able to read my first post to the newsgroup, but it seems that either 1) it didn't make it out to the rest of the civilized world or 2) no one felt like replying.. Would someone at least respond (from outside of university of waterloo) so that I know that this did reach the 'net'??

I have several questions: is MiNT at all usable on a 1 meg ST?
Is TeX Usable on a 1 meg ST w/ hard drive?
If the answer to either is yes, would someone PLEASE either send me a list of files I need, or point me to a file outlining which files I need? I can access most of the free world through ftp, so I can get the files myself.

I recently got bash-bin and bash-doc (in lzh format) from a.a.u.e...
LHA (on the PC) wouldn't unarchive either one, lharc would, but the bash-doc file was messed up, and the bash.ttp ran and returned to desktop in 1ms.. Did I get a bad copy, or do I specifically need to unarchive them on the ST??

Also, I'm interested in whatever happened to Megamax as I have Laser C and am wondering if a later version is available.

Regarding the 2/6 TOS chipsets - I opened up my 1040STFM, and found 2 chips in sockets, with the other 4 punched out on the PCB, but 'soldered up'. I haven't checked the serial number with the one posted here before, but is there a chance I can get the 6 chipset to work? What is the retail price of tos 1.4 right now?
Or, how much is 2.06 right now for the older ST's?? I have a socket for blitter on my motherboard as well - does this mean I can buy one and stick it in? Is there any purpose to this - ie do more than a handful of programs actually use it? Will it work? How much is a blitter going for, and where can I get one?

I would be very appreciative for answers to any of my questions.

Mattias Hembruch

Please reply to either 1) the net,
2) mghembruch@electrical.watstar.uwaterloo.ca or
3) ec333way@sail.uwaterloo.ca

350. Staying installed over a resolution change?

Newsgroup: comp.sys.atari.st.tech

From: sourada@iastate.edu
Message-ID: <sourada.696370213@vincent1.iastate.edu>
Source record: 45953

How can you get the Desktop to inform your resident program that the resolution has been changed, so vectors you have messed with can re-install?

I didn't know until I tried it that it seems that the vectors I was using in a program got reset to their original values when there was a resolution change at the Desktop. (The vectors I was using, BTW, were etv_timer, the vbl autovector, and the ikbd autovector. At least the etv_timer vector was restored to its old value).

So, I need some way of telling my resident program that it needs to re-install its vectors. I can't seem to find any reference to a vector that is jumped through at a resolution change in the docs.

Thanks,
Steven Ourada

well, roger, maybe it's time to come of age with good old CLIs :-).

there is nothing stopping you from invoking C-Kermit from the desktop. just start it up with no parameters. admitedly there are no menus or dialogs, but it works (which is all that really matters). the other advantage is that it works basically the same everywhere so that you only need to learn one user interface.

fingers are made for typing (that's why you have so many of them :-).

CH> ones that look like real mice, and you click their eyes...

CH> --
CH> ----------======================== _ /\
Buss mice are possible.. I have heard the Microsoft Buss mouse can be used on an ST if you either make an adapter or if you modify the cable.
You must have compatible lines comming out of the mouse for the buttons and for the movements.

Source record: 45865

Well the folder program should be used in tos 1.4 as a "files" type setting..
You need poolfix though for a bug they introduced when they fixed the file limit.

The folder program is NOT needed unless you think you will have more then 40 handles open..

The only time you will run into a problem is if you are multi tasking or you have a bunch of file handles open.
remember that different devices have file handles opened to them too..
Such as your keyboard, screen,modem and a couple other things.

Under normal usage it is doubtful you will ever reach the 40 file problem.

The bug was that when you grabbed a file handle it wasnt being released when you quit so you had to reset the computer every so often to reset the file handle bug.

Now it releases them fine. YOu just are limted to 40 at a time. The folder program will allow you to specify the number of files you want..
(Gesh atari should provide an entry in their .cpx for setting this!)

I believe version 3.1 is not but 2.9 is.

> Also, I'm interested in whatever happened to Megamax as I have Laser C
> and am wondering if a later version is available.
What version of Laser C do you have. The last version, released ages ago was 2.0 (or was it 2.1? I forget.) At any rate, new versions are not forthcoming.

Consider it done.. I see Charles johnson has released Pinhead 20 on GEnie
today, and I am using it now, I love it.. I know have MERCURY working 100%
so thanks for sending it Roger, it will work with forem as well by the looks
of it as a door. It will even work with our MBBS usenet reader as well.
I uploaded Mercury for those of you who are interested to GEnie last night`
it is file number 22402 in the Atari RT on page 475.

if that is the problem you can always do a
_malloczero(1);
call somewhere in the initialization. _malloczero(truep) toggles
clearing of malloc'ed memory in the library.

cheers,

358. cold and warm resets

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-26 22:17:42 UTC
From: sslee@micromed.net.netcom.com
Message-ID: <84g7eB3w164w@micromed.net.netcom.com>
Source record: 45965

What is the simplest way for an application in the AUTO folder to
determine whether the machine was just turned on or was started
by the reset button? There doesn't seem to be a memory location
in the BIOS variables ($400-$4ff) that indicates this.

359. running from GEM or application

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-26 22:26:09 UTC
From: sslee@micromed.net.netcom.com
Message-ID: <aiH7eB4w164w@micromed.net.netcom.com>
Source record: 45964

How do you determine whether a program was started from the GEM
desktop or from an application such as COMMAND.TOS? I want to
bring up a dialog box if it was run from GEM only. This way the
user can input arguments to the program.

I tried looking at the basepage to determine the parent's basepage
address. How can you be sure the basepage is GEM? Currently,
I assume it is a GEM basepage if the address falls within a
certain boundary. However, this does not seem guaranteed to work
all the time, especially if TOS is in RAM.

Source record: 45966
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Yes, the 386SX is basically a 386 32bit CPU in a 16 bit package. It will run all 386 stuff, just slower because of the data bus. The IBM people say it's a crippled CPU, I guess in a way it is. With costs constantly coming down on the 386 now that the 486 is out and "THE THING" I don't know if it's even justifiable to get a 386SX anymore. Of course for someone NORMAL it would still be plenty of horsepower ... unless you want to run windows.

Just my opinions.......

361. Memory hogging in MiNT 0.92

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-27 09:29:28 UTC
From: neuhaus@altair.informatik.uni-kl.de
Message-ID: <neuhaus.696504568@altair>
Source record: 45971

Hello.

First of all, I want to thank Eric Smith for his wonderful
job he did with MiNT. It was easily installable and the
version of tcsh that I got from aa gave me the feeling that
I was sitting at a UNIX box here at the University.

However, there is memory loss in MiNT 0.92. When in tcsh,
I did the following a couple of times:

```
# cat hello.c | cat | cat | cat | cat | cat | cat | cat
```

Before I did this, I had some 3 MB free. After the big pipe
was finished, there were some 2.7 MB left. I iterated this
for some times and, sure enough, got a "virtual memory
exhausted" error from cat. (The first time ever on my 4 MB
Atari :-)

My Atari is a 1040 STF with 4 MB and TOS 1.4. MiNT is
version 0.92. Cat is a TOS domain process.

A last question: Yesterday, I tried the following:

```
# du > dufile &
[84]
# tail -f dufile
```

While this seemed to work, I had problems when the du was
finished and I tried to kill tail with ^C. It didn't work.
Am I correct in believing that this is because tail, too is
a TOS domain process and can't benefit from MiNT's
`accelerated keyboard interrupts'? How do I create a MiNT
domain process from TOS executables?

Again, 1024 thanks for MiNT, to everyone who contributed.

|>
|> Stig Vidar Hovland - stigvi@lise.unit.no

That's not perfectly right. The 386SX is a 32bit processor, but unlike the
"normal" 386 is has only got a 16bit wide external bus. Internally it's got
32bit registers, just the same way as the 68000. If there's any software
which really uses these 32bit is another question...

>trouble preserving 'hard' CR's, so why should the ST version?

Don't know about this one as it's not a problem that I have but it must be
possible - most things are with emacs.

>
>Similarly, how would I go about creating a mode (or defining the key)
>so pressing enter caused CR and LF to be inserted?

Modify the keymap either for a special "ME" mode or for the global keymap. This
is described in the manual in the chapter on customisation. This may be
possible by a fix something like the fix for C-s being hold on vtxxx terminals.
This is detailed in the PROBLEMS doc but it basically consists of replacing C-s
with C-\ and setq'ing the keyboard-translate-table. This is done in the
emacsini.el (.emacs - see below).

The following line in my .emacs defines C-x! to be the function
this-line-to-top-of screen (a function I wrote myself).
(define-key global-map "\C-x!" 'this-line-to-top-of-screen)

I may as well include the keyboard translate table stuff for C-s as well

```
;; Suggested fix for Isearch at startup problem
;; Make a keyboard-translate-table
(let ((the-table (make-string 128 0)))
;; Default is to translate each character into itself
(let ((i 0))
(while (< i 128)
(aset the-table i i)
(setq i (1+ i))))
;; swap C-s with C-\
(aset the-table ?\C-\\ ?\C-s)
(aset the-table ?\C-s ?\C-\\)
;; swap C-q with C-^
```

```
(aset the-table ?\C-^ ?\C-q)
(aset the-table ?\C-q ?\C-^)
(setq keyboard-translate-table the-table)
)
```

>
>(Bonus Question): What is the name of the .el file (and where does it
>live) that I can put startup commands into? On my Unix box here it's
>".emacs" but that obviously won't work on the ST.

This one I do know !

It's called emacsini.el and it lives in your root directory (where emacs is started from). I found this out more by luck than anything else - I think it's in one of the README's that come with it.

Hope all this helps to solve the problem - If you manage it I'd be interested in the solution.

Source record: 45976

If the infamous RTS/CTS bug wasn't fixed in my TOS 3.01, all I can say is ARGGGGGH! I'm sure after 6 years, Atari can get a simple bug worked out! If this IS the case and the bug is still present in 3.01, then Atari BETTER offer 3.06 as an upgrade, or I'm NEVER touching another Atari computer for as long as I live. TurboCTS just hangs my TT, so that's not an option. Going back to my 2400 is not an option. Buying a Mac is! I pay $4000 (Canadian) for this system (after being loyal to Atari for 6 years) and it can't even handle today's modems! THAT IS PITIFUL.

PS This IS Atari bashing (1st time I've ever bashed Atari), and I'll sell my TT and get a REAL computer if there's no way to get my 14400 to work with my TT. I haven't even heard of any 1.44meg floppy upgrades from Atari yet! ARGH!

Even though I own a Mega STE myself, I haven't tried to plug in a 1.44 drive,
but I know that the drive would read 1.44 disks correctly, but it won't write
or format them... I have heard something about the hardware not being ok, even
though Atari had intended to make the MSTE able to use external 1.44 drives...

374. Wierd problem

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-27 18:56:58 UTC
From: five@sys6626.bison.mb.ca
Message-ID: <N288eB7w164w@sys6626.bison.mb.ca>
Source record: 45978

Does anyone out there know if GFA Basic 2.0 is COMPLETELY compatible with TOS 1.6?

I've come across a strange problem in a game that I am programming. The game has been working very well up to this point. In one place, I am PUTting a graphic image to the screen upon the user doing something. No problem> This has been working fine.

But NOW, when I try to add NEW things to the program, GFA will report 2, or 3 bombs, when the program tries to PUT this graphic image. (It's a small image. About 80 x 40). It doesn't matter what the new thing in the program is. And the new thing, is never graphic (no Gets or Puts) in nature.

Anyone have ANY clues on this? I've gone over the code, countless times. I'm convinced that it's a compitibility problem on GFA's part.

Any help would be GREATLY appreciated, as now, I can't continue to add new features to this game. (I'm speaking of my 8 sided dice Yahtzee type game - 8Z).

Thanks for any help.

375. Re: Tcsh problems (SOLVED--sort of)

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-27 20:15:47 UTC
From: willing@pantheon.icsl.ucla.edu
Message-ID: <5737@lee.SEAS.UCLA.EDU>
Source record: 45979

I did some poking around this weekend, and I have solved the mystery of why tcsh didn't work right for me while others saw no problems.

To isolate the problem, I tried various operations under tcsh while tracing system calls under MiNT (using ctrl-alt-f1). Curiously, it appeared that a simple call to "ls -l" was rather complicated. Tcsh was searching through my whole path with each extension to find "ls.ttp". I found that odd as tcsh should know where ls.ttp was by looking in its hash table. The tcsh command "hashstats" confirmed that most of the time, the cache was missed. Hmmm. This sent me to the tcsh/csh manuals. Under "hashstats" I found words to the effect: tcsh searches all path elements that do not start with the character "/". That hit me right away---I was setting my path with GEM-style backslashes (mostly for compatability with other shells/prgs). Whereas Eric's tcsh port recognizes / and \ interchangeably in most places, apparently in the hashing code, only paths beginning with / are handled correctly.

So, I changed my path to use Unix-style paths and my problems seem to have gone away. Now the cache is very efficient and so programs start faster as well. What I can't explain is the bizarre symptoms of the problem. With the old path, MiNT and/or TOS was getting corrupted, both in directory/symlink handling and memory management. When problems arose, returning to the desktop was of no help; only rebooting could clear up the mess. So while I've isolated the problem, the full explaination will require more analysis.

IN SUMMARY:
To use the current port of tcsh.prg under MiNT:
1) Don't set its "fastbit"; there is some bug tcsh's startup code that expects the heap to be zeroed.
2) Use only path elements that begin with "/".

I'm much happier now...

The capture buffer is for capturing text into a file, i.e., pretty much the same as an ASCII no-protocol download. It's got nothing to do with *up*loads, anyway.
>
>3. Can someone explain what this means, Note: I used the DO option in

>`CONNECT' or whatever it may be message, just leave out the
>`Connect msg' entry,
> The dialer will then immediatly start executing the macro file after
> sending the number string..
>---
>...

In the dialer menu, you can specify a "Connect msg" which is a string that Uniterm will look for after sending a dialing command to your modem. When this string is received, the dialing process is complete and Uniterm lets you start interacting with the remote system. If you press a key before Uniterm receives this message, dialing mode is aborted.

If you leave this field empty in the dialer menu, then Uniterm will exit dialer mode as soon as it finishes sending the dial command.

With each entry in the dialer menu, you can specify a macro file to execute as well as a phone number to dial. If you do so, this macro is executed as soon as Uniterm exits dialer mode. So, the above paragraph from the manual means, e.g...

Say you have a Hayes-type modem (doesn't everyone?) that responds "CONNECT 2400" when you establish a 2400bps connection. You could enter the string "CONNECT" in the Connect msg field of the dialer menu, and then Uniterm will know that when it sees the word "CONNECT" come back from the modem, that dialing has completed successfully. But suppose your modem does autospeed, and there's a chance you'll only connect at 1200 or 300. Then you might want to write a macro that can read the connect string itself, and set Uniterm's baud rate automatically. So, leave the Connect msg field empty, and have your macro look for "CONNECT" (300 baud), or "CONNECT 1200", or "CONNECT 2400" by itself...

Similarly, there are Fail 1 and Fail 2 strings in the menu. I usually set these to "BUSY" and "NO CARRIER". Of course, in current versions of Uniterm, these entries are both unused in the dialer, so it's really pointless...

>all the time, especially if TOS is in RAM.

This was discussed a year or two back. One method which I have used
successfully is to look at the basepage of the running program, then check
its parent, and then its parent and so on, until you run out of ancestors.
If it takes one hop to get to the father/mother of all processes, then the
program has been run from the desktop; any more and it has come by way of
a shell (or two).

I can dredge up the source, if anyone's interested.

379. The Parallel Port: Speed?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-28 01:59:46 UTC
From: warwick@cs.uq.oz.au
Message-ID: <6349@uqcspe.cs.uq.oz.au>
Source record: 45983

I have just bought a Canon BJ10ex Bubble Jet printer to hang off my 520++ST, TOS 1.4, but since the BJ10ex prints 360dpi, 64 dots at a time, 83 cps, 10 cpi, when I use image modes, that works out to 23904 bytes per second.

So how fast is the parallel port? Even copying a file directly to PRN: cannot seem to provide sufficient info to the printer to keep it running. I have tried doing the same thing (copy file to PRN:, actually LPT1:), on an IBM 386 and it was fast enough, so it couldn't be the printer.

Can the printer-port speed be increased by software or hardware?

Does the TT port promise to be any faster? (I can't imaging 24Kps is limited by the CPU).

3.1 is usable, just. I had room for FATSPEED and FOLDR080, and that was
pushing it. Of course, my copy has initex and virtex in separate executables;
newer versions merged them, and that might not fit.

Well, after my TOS 1.4 ST died a lingering death, I have a STe on the way...

Questions:
What bugs from 1.4 were fixed in 1.62 and what bugs still exist/were introduced. (Do I still need POOLFIX and TOSFIX?)

Also, I need recommendations on a good PD or Shareware HD Defragmenter and backup utility, along with a good C compiler. I good general HD utility package would be nifty too...

>and sink current as the 74F244 parts.

If you really have a problem, try replacing the LS units with ACT parts.
ACT logic is slightly faster than F series, and also produces very nice clean
outputs (great for driving DRAMS).

Maybe these questions are FAQ, but still ...

What is the difference between the WM_TOPPED and
WM_NEWTOP messages ?

When a WM_REDRAW message is received, the AES sends
a rectangle with the message. Exactly what part of
the area to redraw is this rect, is it the same as
the first rect in the windows rectangle list, or
what ?

BTW, I have RTFM:ed, but I can't seem to straighten
these questions out.

There is a german PD program called WINX.PRG. With WINX you can get upto 128 windows opened a time. WINX is used like FOLDRXX.PRG. Substitute the X with the maximum number of windows you like. This is really nice in combination with MultiGEM. And now the bad news, WINX.PRG in the actual version does only work with TOS 1.04. But the one who wrote it, is working on a version for the other TOS versions.

Maybe someone can post it to comp.binaries.atari.st. Sorry but I don't have it.

Well I seem to have got some thing to work, what I was after was a Auto
logon by using a macro file to do this, in the dial option..

But I am not using any 'connect' in the macro, but what I have done works..!!

Thanks..!!

In fact, there is no safe way to determine wheter your program was started as an applikation or tos-program. (although there are dirty bindings in Lattice and (as far as i can remember) Sozobon C).

Think of a coming MultiTOS and remote-Shells...

Frank

There are even more bad news. This version only runs with a plain german
TOS1.4 (it wouldn't even run on a swiss TOS1.4 :-(). Therefore posting
is probably not the best idea...

greetings, pat

Source record: 45842
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am using gnuemacs 18.57 and Bammi's ispell port (both are
excellent ports, many thanks to Scott and Jwahar). Howerver,
I am unable to invoke ispell from gnuemacs using the ispell.el
in the ispell package. That does not surprise me, as I would
expect to have to set an environment variable or a path in the .el
file. However, after playing around with it for awhile, I could not
get it to work. Does anyone on the net use ispell from gnuemacs (18.57)?
If so, would you let me know what I have to set up in order to do it?

On a related note, Edgar Roeder(sp?) posted a compile.el and then
a patch to it to create a compiles.el. My version of patch will not h
handle this file. Would some kind soul email me an updated compiles.el?

Thanks in advance!

So far these fixes are debatable...

There are no good PD backup programs and nill optimisers that I could trust,
the Turtle thing neads to much ram, and I know of no optimisers that
work ok..!

The othere problem is a clean up utill, you can't back up you hard
disk or optimis it, if the file structure is corrupted..

There are some commercial ones, but then you nead money for them..??

ICD makes a good Cleanup utill, but then I have had it fail on me,
Ataries Check Disk3 gave a cross linked cluster, but clean up did not,
KnifeST pointed to one file and the PD check disk pointed to another..

I ended up deleting both files, as they were not neaded, but what can you
Trust..??

Hello, I seem to be having trouble using manx's Aztec shell v3.6a
under spectre (v3.0). Whenever I try to launch the shell spectre bombs
and returns "bus error"... this bomb is not recoverable (I can only restart
the finder).
I use this shell alot at work as a platform for the aztec C68k (MPW)
compiler. It works on all the machines at work (plusses,se's,II's) and I was
really suprised to find it crashing with spectre.

any help or insight would be appreciated. thanx.

From: herborth@riipsdev.Waterloo.NCR.Com
Message-ID: <8893@ncrwat.Waterloo.NCR.COM>
Source record: 45847

Yup, yet another dead ST story... :-(

Last night, I unplugged my hard drive from my ST so I could mount one of them properly inside the case. After fiddling with my hard drive for an hour or so, I put it back on my desk, plugged it in, and went to turn on my ST, to make sure I hadn't accidentally mangled my drive or plugged the DMA cable into the wrong port of the ICD Host.

I turned on my ST, and hey, no hard drive! Waitaminute, I've got SCSI-Wait2 on my boot disk, which _was_ in my floppy. Hmm, that's strange.

Ctrl-Alt-RShift-Del. Hmmm, no drives at all. That's a pain.

I check all my connections, push down all my socketed chips, and try to reboot. Oh, neat, the ST doesn't even get past the memory test when you first turn it on (you know, the time between turning it on, and the first floppy access).

I fiddled with my hardware for about an hour, and still couldn't get it to go any further. I even tried removing my Z*Ram board, but to no avail. Nothing seems to make any difference, although for a short time, the screen display area on my colour monitor (I was using colour, since it tends to show more during the early phases of a boot) went completely black during these abortive boots for a while, leaving the border nice and white.

Anyone have any idea what might be wrong? Did I fry my CPU/MMU/brain?

I'm hoping someone out there has tried this...

I want to connect an HPIB interface printer to the parallel port. It
looks like I can connect the I/O lines directly and then connect the
parallel STROBE to the HPIB DAV and the parallel BUSY to the HPIB NRFD.

Has anyone tried this? Does this look reasonable?

Thanks alot,
Randy Hosler

Source record: 45848

In article <1992Jan28.095549.1026@etek.chalmers.se>, fabian@etek.chalmers.se (Fabian) says:
>What is the difference between the WM_TOPPED and
>WM_NEWTOP messages ?

The difference is that one tells you that the user wishes to top a certain window, i.e. he has clicked on it, whereas the other one (WM_NEWTOP) tells you that a window has already become the top one, normally because the previous top window was closed. The typical reaction to WM_TOPPED is to top the window using wind_set(), but in principle the application is free to do something else.
Now for the bad news: WM_NEWTOP is *never* sent by the version of GEM used in current ST/TTs. In other words, you have no chance to notice a change in the top window. Equally bad is the omission of the message WM_UNTOPPED, which tells you that some *other* has been topped. Let's hope that Atari will implement these messages in the future, since they would be very useful...

>When a WM_REDRAW message is received, the AES sends
>a rectangle with the message. Exactly what part of
>the area to redraw is this rect, is it the same as
>the first rect in the windows rectangle list, or
>what ?

It's a rectangle that covers the whole area to be redrawn. To find out which reactangle(s) of a window actually have to be redrawn, you must find the intersection between the redraw rectangle and all the rectangles making up the current visible area of the window.

Jim Patterson opines:

|Steven D Ourada asks...
|>How can you get the Desktop to inform your resident program that the
|>resolution has been changed, so vectors you have messed with can re-install?

|I believe making your program a desk accessory will do that.

cough *sputter*

Um, no. Desk accessories should not steal trap vectors. The Desktop
won't inform a TSR that the resolution has changed. You can write a
desk accessory or CPX that tells a TSR that it's res change time. The
DA or CPX could communicate with the TSR via a cookie in the cookie jar.

I just bought a 1040 STFM (a demo) to replace my old 520fm which died. I find that in color mode (using a TV), I'm getting a lot of interference (lines like
\
\
\ moving left and right on the screen. I did NOT have this problem with my old 520. I have tried adjusting the potentiometer in the rf modulator but it does not seem to make a difference. Also, the machine seems to 'buzz' a lot more than my old one did when there is a lot of activity (ie graphics & sound). I switched from channel 3 to 2 and it helped somewhat. Is there anything else I could do? I would try grabbing my old rf modulator, BUT it seems to be soldered in just like the new one, and I don't really want to do a lot of soldering.. Anyone have any idea?

On another note, I read in my ST-Internals that the audio out pin on the monitor plug is suitable for output to high impedance headphones. Is there an easy way to make an adapter to 'tap' the audio out signal to headphones or maybe a CD-in line on a blaster? Is there maybe a file @ a.a.u.e that describes this?

Mattias

Use the history buffer instead. You can scroll the history buffer, copy/paste
text from it, etc. You can also save the buffer to a file.

The Vault is very good - supports 1 or 2 drivers, various formats (eg 10 sectors), writes track to floppies, optimises packing of files onto floppy, creates TOS format disks, keeps history, supports archive bit and incremental backup.

Pretty cool really. I actually don't mind backing up these days. It gives me a warm, fuzzy feeling of security too!

I am having trouble adding a second hard drive to my 520ST. I have a Berkely BMS host adapter with an Adaptec 5000 (4 MFM ports) SCSI card. My first drive is logical unit 0 and has always booted/worked fine. I added a second drive as LUN 1; the supra software lets me format and partition it OK but I can't get it to be recognized as having partitions F, G, and H when I boot up. (Icons are there, but the driver doesn't recogize those drives; ie. DRVBITS doesn't have them in it.) My first drive has C, D, and E. Any help on how to get my second SCSI 0, LUN 1, drive to have partitions F, G, and H would be greatly appreciated.

As long as we're discussing Uniterm and Kermit, here's a problem that's been bugging me for a while:

According to my Uniterm manual, when running at 8 bits no parity, Uniterm's Kermit says "to hell with 8'th bit quoting" and just sends its binary data raw. Unfortunately, the kermit at the other end [C-Kermit 4E(072)] never heard of such a thing, and after RTFM'ing for a while I can't figure out how to persuade either one to change its attitude. I'm running Uniterm v2.0e, I think 011, but I'm not sure how to tell. Any ideas?

Make sure that your monitor cable is in firmly. My cable seems to have become flakey and sometimes my whites take on a yellow tinge. Could be that the blue component isn't making it to the monitor. When I readjust the cable, the colors return to normal.

This could be a bug in tcsh rather than one in MiNT -- I'm not sure, though, and I'll try to track it down.

> `accelerated keyboard interrupts'?

No, `accelerated keyboard interrupts' should work for any process. Did you try ALT-CTRL-C? That should usually kill the program; if not, either it is catching the GEMDOS terminate() vector or there is a bug in MiNT :-).

> How do I create a MiNT
> domain process from TOS executables?

This isn't possible; nor would it give any benefits. The domain of a process affects how certain system calls will behave; a TOS program might become confused if, for example, Fread() started to obey the terminal characteristics set by stty(), since TOS programs don't know about these.

> tcsh port recognizes / and \ interchangeably in most places, apparently
> in the hashing code, only paths beginning with / are handled correctly.

Oops -- I must have missed that. Thanks for bringing this to my attention.
(Just a note: tcsh automatically converts / into \ when exporting PATH
into the environment, so you don't really have to worry about
compatibility with other shells. Also, prefixes like "/dev/d/" get
converted into "d:\"; so
(1) setenv PATH :/dev/c/bin:/dev/d/bin
gets converted to
(2) PATH=,c:\bin,d:\bin
in the environment. (The MiNT library automatically converts PATH
to/from POSIX form on start up, so programs compiled with it will
see form (1); other programs (e.g. gulam) will see form (2)).

I don't know how using \ could cause problems with symlinks, though.
I'll try it myself and see what happens.

Regards,

This method won't always work. The GEM desktop can be started by another
program, e.g. from the AUTO folder. A real world example: if you put
MiNT in the AUTO folder, it will start the desktop up, and so the
"mother of all processes" will be MiNT :-).

Myself, I usually use argv[0] to see if I've been started from the
desktop -- a good library (e.g. the gcc library) will put a sensible
string here if the program was started from a shell that understands
the ARGV convention (most do, these days) and will put an empty
string otherwise (e.g. when started from the desktop).

>to PRN:, actually LPT1:), on an IBM 386 and it was fast enough,
>so it couldn't be the printer.

>Can the printer-port speed be increased by software or hardware?

What exactly is the problem..?

A printer should just accept data from a computer at the maximum speed
it can. If the computer sends data too fast, the printer will tell it
to stop until it can catch up. If the printer is faster than the computer
can send data, it will just pause until the computer fills its buffer
again.

Are you saying the printer doesn't print the file at all, or is it
just slower than you think it should be..?

To answer the question, no.. there's no software speedup possible.. the
parallel port operates at the fastest rate possible, limited only by the
speed of the slowest component in the handshake.

Hewlett-Packard has a hardware speedup for its Laserjets (for the IBM)
that I believe I read works by using data compression somewhat similar
to the way v42.bis modems work, but it's not available for the ST.

413. HELP needed on handling forms !!!!

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-29 08:54:49 UTC
From: kuykens@amc.uva.nl
Message-ID: <1992Jan29.095449.70@amc.uva.nl>
Source record: 45822

Hi there,

Twice I have been trying to develop a shell as an interface to
a TTP program I am working on. Twice I bumped onto the same problem.
I use a form defined in a source file to perform user interactions .
I have two problems :

1. How can I handle an edit field, i.e. how do I set and get
the string's value ?

2. The form_do seems to work OK for buttons and switching
between edit fields. However, when I stand in an edit
field characters entered on the keyboard do not appear
in the field. ALso, in some cases I am not allowed to
place the cursos beyonf a certain position in the editline.
I DID set the text template to allow to fill the complete
box.

Could anybody give me a hint on this issue ? I would appreciate some example
code which would illustrate the solution. If possible please send responds
through e-mail. I do not read this news item regularly.

thanks, Hans Kuykens

414. PC DITTO2 modification

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-29 09:28:49 UTC
From: coope@bert.cs.byu.edu
Message-ID: <1992Jan29.092849.16586@hamblin.math.byu.edu>
Source record: 45862

I have and use PC DITTO2 regularly. I don't want two machines on my desk, but need to use MS-DOS now and then. PC DITTO2 always annoyed me in that it threw up the screen asking me whether I wanted to go to DOS or to TOS -- I just ran the program, so OBVIOUSLY I wanted to go to DOS! Then, when I later hit <ctl><alt><del> it asked me the same question. Here, I guess there is room to ask, but generally I wanted to return to TOS.

I twinkled the code so that it doesn't ask the questions, just does the normal thing -- goes to DOS on the way in and to TOS on the way out. This lets me use superboot to select PAF or LOGO or GWBASIC or <name your favorite DOS program> with one function key and have it go clear through with no further key presses.

The following patch needs to be applied to the file PC_D2.1 at offset $A280 from the beginning of the file. (You must be using PCDITTO2 rev 1.0001, and the patch only works if you have a color monitor. Something similar would have to be done to PC_D2.2 if you had a monochrome monitor, but I don't and can't test it.)

OLD CODE: 6100 0228 B83C 000D 6700 000C B83C 001B
NEW CODE: 280A 45FA FFFC 24BC 6000 0142 2444 6006

What this does is patch out the subroutine call to get a char from the keyboard, followed by a comparison for <return> or <escape> with instructions that do the following:

Save an A register
point to the beginning of the patch
move a branch instruction to the beginning of the patch so the next time through we will just go to the TOS restart code
restore the A register
branch to the DOS start code.

This makes PCDITTO2 a lot more like a normal application, and with Superboot set up to preset the AUTOEXEC.BAT file with load instructions for specific programs, I can go to particular DOS programs with one button.

CAVEAT: I won't be responsible for any messes you make with this kludge. It works for me, and may work for you. I'd make a backup of the file before I diddled with it if I were you. I don't know what is the best tool to make this change -- I used PDOS. You may find it easiest to write a C program. I don't think I want to send out my own modified file, because it still contains copyrighted stuff, even tho' Avant Garde is long gone. I would like to hear from anyone that has done anything else interesting with PCDITTO2 -- there is no support, but with interested users we might share tips.

DO NOT DO THIS IF YOU WANT YOUR PROGRAM TO RUN IN THE FUTURE!

I don't know exactly what the new multi-tasking version of GEM will be like,
but it's a good bet that the parent processes of a child process may not
always exist.

Just this sort of thing causes programs compiled using the Sozobon compiler
to crash under MiNT.

But as the 80386SX have a 16bit databus, it is indeed a 16 bit
processor. The same way the M6809 and 8088 are 8 bit processors,
the M68000 a 16bit and the M68020 a 32 bit processor. If this
practice is not followed, you can say that the M6800 is a
8 bit processor and the M6801 a 16 bit even they are almost
identical.

Message-ID: <1992Jan29.125338.20394@Informatik.TU-Muenchen.DE>
Source record: 45868

Hi Atari Users,

I have got a question:

Several weeks ago I bought the HD-Kit from Hard&Soft A.Herberg and
the TEAC FD 235 HF floppy drive (also from Hard&Soft).
Calling Hard&Soft they said the controller VL1772-02PC in my MEGA ST
is ok, but it doesn't work at all (grumble :( ). So I changed it to
the WD 1772 PH 02-02. Now the HD mode runs for several minutes, but it
stops as soon as the computer has 'warmed up'.

Who has any experience with HD-Kits and floppy controllers?
Who has the same or similar problems and isn't satisfied with his
HD-Kit?

Thanks for any information and help.

Andreas.

I have a similar problem: I have MiNT 0.92 and TOS 1.04, 2.5 MB ram. I am using bash 1.10 (MiNT-Version) and an own port of MicroEMACS 3.11 (I will post it soon). When I suspend Emacs, call gcc from bash in the background, then return to emacs and leave it, I miss about 300-400K of memory after gcc is finished. (This is currently not really a problem, because in most cases gcc runs out of memory, when I invoke it in that way.)

Hello, I have an Atari 1040 ST with 1mb of ram, and a megafile
30 HD..

I'm looking for someone selling Minix cheaply because I'm sick of
TOS and I want some unix-like experience at home on my machine instead
of everywhere else. So basically what I'm asking is if someone is
selling Minix cheaply I would be most grateful. I don't have a lot of
money right now, but please make an offer. Thanks!!

Hmmm ... I think the GEMDOS routines handling the parallel port are
not very efficient.

>Can the printer-port speed be increased by software or hardware?

You can write your own device driver routines and link them into the
BIOS output vectors (the ones at 0x4fx...). A normal printer should be
able to accept data at about 50 k / sec.

Theoretical maximum speed for the port is at about 500k/sec (when done
as a fulltime job by the CPU, without any handshaking).

That's a servicable idea, but what about TOS shells that use ARGV and
allow you to run GEM programs?

Atari might be able to guarantee (note: I am saying "might" not "will")
that desktop-launched programs (or, more properly, shel_write()-
launched programs) are started up with an empty argv[0]. This would
require all TOS shells with some sort of 'gem' command prefix to put a
null program name in argv[0]. This also means that GEM programs
trying to learn their name via shel_read() will get a bogus name
if run from a shell... but that's already the case.

Unfortunately, none of this helps Steven Lee if his program is trying
to determine if it was run from COMMAND.TOS. Sorry, Steven.

I have been trying now for a few days to get Ghostscript to function on my 1040ste, and I keep getting "Cant find Fontmap!". What's up with this? Also, after I give it the driver and the filename in the command line, what do I do at the ghostscript prompt to print a file?
Please e-mail suggestions to be824@cleveland.Freenet.Edu

427. Redirection problem

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-29 20:35:23 UTC
From: heijink@dnlunx
Message-ID: <heijink.696717323@dnlunx>
Source record: 45889

I use Lattice C version 3.04. Currently I try to find out how redirection works. With output redirection I do not have any problem. This works fine.

Input redirection is something different. The problem is that Lattice C does not recognize end of file.

Using a disassembler and some experiments I discovered the following.

Lattice uses a level 0 input routine called dread.

dread checks for the level 0 file handle. If the file handle has the value 0, it assumes input from the keyboard and invokes the GEMDOS call Cconrs, otherwise it call Fread

Cconrs reads a string from the keyboard and allows some limited editing, like you normally would expect when entering data. Fread essentially does a block read.

The problem is that Cconrs does not recognize end of file.

I see two possible solutions:

The first one is to find some way to determine whether handle 0 is connected to the keyboard or to a file. Is there anybody on the net who knows if this can be done and how this can be done?

The second possibility is to write my own Cconrs replacement with Fread calls. This looks not completely trivial, at least I do not like the idea to have to do this. Has anybody experience with this or has anybody alternative solutions?

I want to use this type of stuff in writing a function that does all things you may want for calling an external program, e.g. path search, redirection, wildcard substitution, environment substitution, pipe simulation etc.
Thanks in advance for your responses.

>Randy Hosler

I doubt it would work. Doesn't the HPIB have a three wire handshake? You've
only accounted for two. Also, even if you matched the electrical spec, you'd
have to go through incredible contortions to match the bus protocol, sending
commands to tell the printer to listen, and so forth. I would put a logic
analyzer on the printer cable while it is being used by a regular HP computer
and watch what goes over the lines before I would attempt to emulate it.
TI makes a chip and set of drivers especially for talking to the HPIB/GPIB,
and even then its a big job to talk to the chip.

429. Fdup-Bug in TOS 1.04 (only?)

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-29 21:39:44 UTC
From: edgar@pingu.saar.sub.org
Message-ID: <H.srFke2UinTo@pingu.saar.sub.org>
Source record: 45804

Hi!

Here is a small example file to demonstrate a bug that seems to be in all
TOS versions up to 3.05 on a TT. If you have never seen the SYSTEM HALTED
message on your TOS > 1.04, you should run this program. But please save
all the files on your (non-resetproof) RAM-disk before trying this. Don't
bother trying to follow the advice (to start foldr100.prg) -- It will not
even help to start foldr999.prg. :-(

Is this still one more bug like the Malloc-bug that will
never be fixed by Atari because everybody relies on it ?

Is it fixed in KAOS-TOS?

- Edgar

```

430. RS232 Port Manipulation

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-29 21:41:32 UTC
From: oracle@iastate.edu
Message-ID: <oracle.696721292@vincent1.iastate.edu>
Source record: 45879

I am looking for information on programming the ST's RS232 port to raise and lower the DTR line as the system monitors the port for a carrier.

I program mainly in Personal Pascal and would be especially greatful if anyone has information about this process or some examples of source code they wouldn't mind me looking over.

Thanks alot!

: STE Did not have one, but I stand to be coreected on that...??

[sig deleted]

You are correct, but the question was about if the SCSI-adaptor
in the MSTE (yes, it has one) can handle more than one device. I'm
not sure about that, but _CAN_ Atari be so stupid that they have
different SCSI-adaptors for the MSTE and TT? I don't think so, so
my guess is that you can have 8 or 16 devices attached to your MSTE
if you just take the SCSI-bus outside the computer.

The more I think about it the more unsure I get. If Atari can be
so stupid that they don't put an external SCSI-bus on the MSTE
they must also be so stupid that they can use different SCSI-
adaptors, or?

Atari is Atari is Atari is..... They haven't convinced me that
they are clever, but I still love my MSTE!

Are you sure that the memory is really gone, or is it just fragmented? That is, it's quite possible that the largest block of memory in the system is now 300K smaller, but there's a 299K block of memory just above or below it (the other 1K having been allocated by MiNT for data structures while gcc was running). I notice that this happens quite often with bash, but is somewhat less of a problem with tcsh (mostly because the bash always uses fork(), which allocates a big chunk right in the middle of memory; tcsh uses the less memory hungry vfork() whenever it can).

>
>Has anyone tried this? Does this look reasonable?
Won't work unless you...

1) replace the parallel port driver software COMPLETELY. The current
driver follows Centronics protocol and will not handle GPIB/HPIB handshakes.
What about the ATN line? What about GPIB/HPIB address? These MUST be
supported also, along with a fairly complex state transition sequence to
support the protocol.

2) you will probably also need to add high current driver/reciever
chips to the port. GPIB/HPIB needs something like 50ma drive capability
and I am SURE the chips that Atari uses on the parallel port can't handle
that much drive current (They are probably only capable of 5 or 10ma at most
probably even less... knowing Atari...).

GPIB/HPIB isn't an easy interface to add to a machine that wasn't designed
to support it... and even on machines designed to support it I have often
seen the implementation done so poorly that you couldn't even use the port
properly (e.g. a certain "Logic Analyzer", NOT from HP, that I know of with
a GPIB port that ignores ALL addresses sent to it. Even though it says the
port is enabled and all options are set correctly. After calling them I found
that they never tested their GPIB interface even though they advertise that
their equipment supports GPIB control!!!! One OLD version of their Analyzer
atleast recognizes its address, but intermitently crashes when sent GPIB

commands... frustrating!).

You can probably get a VME card that will fit the TT though that will handle GPIB fine.

434. Ack! My STe is dying! (dead?)

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-30 04:01:58 UTC
From: atilghma@sdcc13.ucsd.edu
Message-ID: <27947@sdcc12.ucsd.edu>
Source record: 45955
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Ack! I'm having serious problems with my STe system. If anybody
could offer some wisdom, I would appreciate it!

Symptoms:

(The first problem I caught) - MINT.CNF suddenly appeared
with random data scattered throughout the "normal" text.

The Desktop is now mistaking executables for Text files,
and is asking me if I want to view them. This
is happening perhaps 10% of the time, and I have
NEVER had this problem (in 6 months of intense use).

MiNT 0.92 is hanging much more often than usual - basically,
anything involving a large file operation, like
running GCC.

On most large hard drive read operations my screen is
overwritten with data :-(

Odd crashes every so often (usually non-repeatable).

On reset, the screen doesn't clear - so if I reboot from
the desktop, my hard drive boot is overlaid on the
old Desktop image.

My Hardware:

Atari 520STe (w/ TOS 1.62, bought in August 1991) - 4MB of RAM
ICD Host Adapter (original model) + Seagate ST1096N drive
DEKA PC Keyboard Adapter (w/ keyboard)
SM124 Mono Monitor

Does anybody recognize these problems? I think they're serious
and there's NO WAY that Atari's going to take back my computer under
warranty :-(... Eek!

Out of curiousity: How are you guys measuring the amount of free memory on your system? Are you sure that you are not just measuring the size of the biggest free block in the system? That may fluctuate depending on the current memory fragmentation...

436. Redirection problem

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-30 07:46:33 UTC
From: heijink@dnlunx
Message-ID: <heijink.696757593@dnlunx>
Source record: 45795

I use Lattice C version 3.04. Currently I try to find out how redirection works. With output redirection I do not have any problem. This works fine.

Input redirection is something different. The problem is that Lattice C does not recognize end of file.

Using a disassembler and some experiments I discovered the following.

Lattice uses a level 0 input routine called dread.

dread checks for the level 0 file handle. If the file handle has the value 0, it assumes input from the keyboard and invokes the GEMDOS call Cconrs, otherwise it call Fread

Cconrs reads a string from the keyboard and allows some limited editing, like you normally would expect when entering data. Fread essentially does a block read.

The problem is that Cconrs does not recognize end of file.

I see two possible solutions:

The first one is to find some way to determine whether handle 0 is connected to the keyboard or to a file. Is there anybody on the net who knows if this can be done and how this can be done?

The second possibility is to write my own Cconrs replacement with Fread calls. This looks not completely trivial, at least I do not like the idea to have to do this. Has anybody experience with this or has anybody alternative solutions?

I want to use this type of stuff in writing a function that does all things you may want for calling an external program, e.g. path search, redirection, wildcard substitution, environment substitution, pipe simulation etc.
Thanks in advance for your responses.

As far as I know, the TT has a real SCSI interface (using the 2nd DMA chip,
I suppose) in addition to the ACSI bus, while the MSTE has a built-in host-
adaptor for the ACSI bus, occupying device no. 0. So, theoretically they
could have prepared it for up to 8 drives, but it is a completely different
thing from that in the TT, and why should they have bothered?

You need to set an environment variable which is a path to search for input files. I believe its called `GS'. It will typically include the current directory, `.', as well as something like `g:\gs\fonts'. Somewhere on this path should be the FONTMAP file. I think you should have got a copy with the GhostScript distribution you have. It maps font names, e.g. Times-Bold, to ST files which contain the font definitions, e.g. ptmb,gsf. If you have trouble getting a FONTMAP file, I can mail you one.

Cheers,

Because the DA will be zapped without notice when the resolution is changed. All of a sudden, your DA's code has vanished, but you're still hooked into some system vector somewhere. If control passes through that vector... crunch.

Yes, I've noticed this. The problem doesn't appear to be that memory is actually being lost, it's that it's getting fragmented. I would guess that bash is starting the foreground process, then allocating some more when it starts the next process (about 50k, it think). Tcsh may work the same way. If you dump the memory list (with CTRL-ALT-F5) you can see this. The easiest solution is just to quit MiNT, then restart. (I'm using 0.92 under TOS 1.4 with 2 meg ram. Maybe when my SST finally arrives I can just start up two MGR windows, and never have to worry about background compiles again!)

(ps. I'll port bash 1.11 as soon as (a) the source arrives at my freindly neighbourhood Sun network, and (b) my SST arrives and I'm back to 4 meg ram.)

A local company used to make a simple GPIB/HPIB adapter for the ST based
on the NEC pd7210 chip.

The last time I was in their shop, they still had four units on the shelf.
If you could get a good price on one, it would save you a lot of trouble.
Call Dr. David Walker, VSI Inc., (604)595-9578 or e-mail me and I'll
forward your message.

A1 A7
A2 A6
A3 A5
Vcc A4

This is the pin-out of the 514400 4x1Mbit chip. Notice the 'A9/TF'. On the
4x256Mbit chips is this pin used for testing.

Here is what do do if you have a ST with 1Mbyte ram and only 8 ram-chips:

0) get the following:
soldering iron with fine tip and a tip for desoldering DIL-chips.
8 514400 100nS 4x1Mbit DRAM chips.
8 20 pin DIL sockets.
soldering tin, wire, and 10cm tinned copper wire.

1) desolder the old ram-chips (probaly 514256 chips)
2) solder the new sockets in the motherboard.
3) test the computer, by inserting the old chips (or the new ones) in the
sockets. The computer should start as normal (still) as a 1Mbyte ST.
If the computer don't work check solderings.
4) now take the 514400 chips and bend pin 5 (A9) so that it is horizitional
rather that vertical as the other pins (give me an english lesson, and I'll
rephrase the sentence).
5) now insert the chips in the sockets and connect all the A9 lines (the
horizitional ones) with tinned copper wire.
6) connect the A9 lines to pin 64 (MAD 9) on the MMU.

/-------------- connect to A9 lines!
/ ...4 3 2 1 68 67 66 65 64 ... \
| O |
| ^ dot on the chip marks pin 1
| MMU |

7) turn on the computer, if it don't work - insert the old chips - if it
still don't work then throw it away and buy a new.

I don't take any responsability for anything you may choose to do to your computer. And that is what 7) is all about!

A fine program is Uniterm. It has Kermit built in, and responds
the the "Help" key in a helpful way.
It is free and is available by anonymous ftp from atari.archives.umich.edu .
I have used it for null modem transfers at 19 200 and was delighted.

There are several versions of uuencode available for free. Two of
them produce files that are what unix would produce, but one, the
most popular around here, is UUE and UUD, which are compatible
with the posix uuencode, allows one to chain files.

>#3 Please note that I know MUCH about the Amiga and ALMOST NOTHING about
>the Atari.

I know almost nothing about the Amiga.

446. Problem with patched STalker 3.01

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-30 19:26:04 UTC
From: cordes@ac.dal.ca
Message-ID: <1992Jan30.152604.3210@ac.dal.ca>
Source record: 45798

Since patching my STalker 3 to 3.01, the feature which lets one select a block of text on the screen has a problem: the last option, Transmit, fails! Instead of transmitting the line which was highlighted, STalker sends the selected block to SCRAP.TXT, in the Clipboard. This is a great pain, since recently I've been using Maple on the mainframe and it's been very convenient to be able to select previously entered expressions for editing and re-submission.
Anybody else noticed this problem?

447. ST msyncs: Sony 1302, Princeton Ultra 14 Querys

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-30 19:57:22 UTC

Anybody using a Sony 1302 with an ST, how about a Princeton Ultra 14?

I am especially interested in difficulties, quality of display but
most of all, I want to know:

Do either or both of these monitors correctly size and center all ST
screens automatically?

That is, do Mono *and* color modes switch easily without lots of fiddling?
I know that Nec 3Ds save settings in Nvram, what about these two machines?

I'd prefer email responses, because I'm behind on my c.s.a.st news
8-). I'll post a summary if anybody is interested.

The ST must be the slowest link then. There is a speedup available
for the ST's printer port, and it recently went from shareware to commercial!

FP (FastPrint if I recall correctly) speeds up laser printer output
from pagestream by %400.... so go find it if you need it. The commercial
version is faster yet.

>
> That's a servicable idea, but what about TOS shells that use ARGV and
> allow you to run GEM programs?

Actually, it seems to me that there are 2 questions here:
(1) What shell was I started from?
(2) Should I put a text message or an alert box up for messages?

The questions are related (e.g. "Started from desktop" implies "alert box is better") but there are distinctions. Myself, I usually assume that:
(1) If the user launched my program from a CLI, s/he would prefer text messages.
(2) A program started from the desktop should use AES calls wherever feasible, and if it has to display text it should make sure to pause at the end of the program so the user has a chance to read everything.

> Atari might be able to guarantee (note: I am saying "might" not "will")
> that desktop-launched programs (or, more properly, shel_write()-
> launched programs) are started up with an empty argv[0].

I can't see any way to do this and use ARGV. I certainly won't whine at all if any of my programs that make assumptions based on the state of argv[0] break if the desktop switches to using ARGV -- I found the argv[0] hack a useful rule of thumb, but I know it's not infallible and Atari has never claimed that it would be.

> Unfortunately, none of this helps Steven Lee if his program is trying
> to determine if it was run from COMMAND.TOS.

Indeed. I don't think anyone's ever come up with an infallible method for determining this, although there are hacks (looking at _shell_p, looking at argv[0], and checking the environment) that often work.

Question: is there a way for an application to tell (e.g. via shel_read) whether or not its running as a graphic or text application (i.e. what the parameters to the last shel_write were)? If not, maybe there should be -- that would certainly be the most reliable

way of deciding whether to up an alert box or to use a text message.

450. Re: 1.2 meg 5 1/4 inch drive on a ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-31 00:21:57 UTC
From: ytsuji@cfi.waseda.ac.jp
Message-ID: <2206@wsdnws.waseda.ac.jp>
Source record: 45814

5"1/4 drives typically requires the high density mode on the part of
your ST. If yours is not equipped with the 1.44 MB drive, you will be
using your 5"1/4 drive in the 720KB mode, most likely. If yours is a
newish TT, I suppose you can use the 5"1/4 drive in 1.2 MB mode.
BTW, the step rate doesn't matter. Why bother a few milliseconds when it
takes 200 milliseconds for your drive to complete a single rotation?
Tsuji

t
>I'm not sure how to tell. Any ideas?

According to the book "Kermit, A File Transfer Protocol" by Frank da Cruz
(the originator of Kermit) the 8th bit prefixing option is ONLY supposed to be
used if the "channel is only 7 bits wide because parity is being used".
The operation of UniTerm is correct to send using all 8 bits unless the other
Kermit tells it that it needs 8th bit quoting in the "S" packet interchange.
Have you looked at a LOG from the C-Kermit of a transfer to see what was
negotiated in the "S" packet interchange?

C-Kermit should also support the same...

8th bit quoting is an OPTION that a Kermit doesn't need to support. (although
it sure helps that most do).

|>If this IS the case and the bug is still present in 3.01, then Atari
|>BETTER offer 3.06 as an upgrade, or I'm NEVER touching another Atari
|>computer for as long as I live.

Unfortunately, the bug is still present, up to TOS 3.05 included. I dunno if
it has been corrected in TOS 3.06. However, that bug was fixed in TOS 1.2 then
has come back in tos 2.01/3.01.

|>PS This IS Atari bashing (1st time I've ever bashed Atari), and I'll sell
|>my TT and get a REAL computer if there's no way to get my 14400 to work
|>with my TT.

Atari has written and dispatched a patch which is supposed to fix this
problem. I have put it on atari.archive, under TT directory. Its name is
"Serpatch" or smth like that.

|> I haven't even heard of any 1.44meg floppy upgrades from
|>Atari yet! ARGH!

Of course, there isn't any yet. However, if you got TOS 3.05 or above, you can
safely handle a 1.44 meg floppy. Just replace the old one and set switch
number 7
(those switches are located under the HD). Be careful to check the
model, if you
do not want to use saw and cutter...

Enjoy.

|>or format them... I have heard something about the hardware not being
ok, even
|>though Atari had intended to make the MSTE able to use external 1.44
drives...

Right. The GAL (or PAL, I don't remember) which controls high-density drives
on the MSTE is buggy. We have published an update, after having read the PAL
and found the bug. If you are interested, I can mail you the JEDEC file to
reprogram it.
The gossip says the bug has been fixed on the new series of MSTE.

However, if the AJAX is one day released on the market, that would be over.
New TOS 3.06 is able to handle 2.88 mbyte drives, though the built-in desktop
is not, I believe (There is no "EXTRA-HIGH DENSITY" option in the format
dialog box, for example).

When will the Falcon be released ?

Hope that will be useful.

>a shell (or two).

Hi John,

well, this may work, if you start your applications from the original
GEM-Desktop. But it won't help if you installed one of these
alternative desktops, as Gemini or NeoDesk. These are also
GEM-Desktops, but with your method of determining the way a program
was started, you can't examine, if it was started by another
GEM-desktop replacement, or a text oriented shell.

I know, this is a real difficult problem, but perhaps anyone out
there got a solution ...

I am looking forward to it. I also noticed a bug in bash 1.10: When you try to start a process in the background and redirect the output of it, and the file to be executed does not exist, bash hangs up itself (no prompt, no input accepted).
I would also prefer it, if one could start a program without entereing the extenstion (e.g start `make.ttp' with `make'). Maybe all suffixes of executable programs could be hold in an environment-variable SUFFIX. (Maybe also other programs, like `ls' will recognize that? - I guess it should be added to the MiNTlibs...)

458. MGR, MiNT 0.92, tcsh -> ack...

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-31 13:56:45 UTC
From: herborth@pinot.Waterloo.NCR.Com
Message-ID: <8916@ncrwat.Waterloo.NCR.COM>
Source record: 45806

I seem to have run into a relatively annoying problem with tcsh and MGR...

If I try to run tcsh as my shell in MGR (under MiNT 0.92 and Bammi's updated MGR binary), I get a BUS ERROR message from the pid that would have been tcsh if it had executed properly. The User PC=1, and the basepage address looks relatively reasonable.

Then, after I try this, and it crashes, if I leave mgr, and try to exit the MiNTshel.prg (which I'm using as a shell, since it is small, and doesn't die in MGR) to leave MiNT, I get:

```
exit code: 0
pid 0 (MiNT): assert(`f->links == 0') failed at line 590 in filesys.c
Fatal MiNT error
```

Does anyone know why I can't run tcsh within MGR? I've definitely got enough RAM (2.5M machine) free, since the only other things I'm running are MiNTshel, lpd, and MGR.

Suggestions? I'm going to try doing all this with my debug level set higher to try to see what's going wrong. I suspect it won't help all that much though... :-\

I have got the word processor Thats Write and in the printout menu it has got the option to print to the parallel port via the BIOS or directly. The manual states that to print directly is much faster. Therefore the BIOS routines must be slow.

Source record: 45815

Ken Badertschera opines:

'Um, no Desk accessories should not steal trap vectors'

Fine, I am trying to write a DA that wants to obtain some information by traping in to a vector. I can split this program in to a TSR and a Desk accessorie.

However the Desk Accessorie needs to able to get any information saved by a TSR. How do I do this ?, I can't use a `known' memory location, because It can change dpending on how many other TSRs are already loaded.

I known the cookie jar can be used to store such information but I have never seen any article on the cookie jar.

1). For do I create/extend a existing cookie jar.

2). Because I want to steal a vector, I would like to use XBRA to share the vector. I there any informastion on XBRA that is public readable.

3). Is there a FAQ for this news group ?

System-specific questions such as this belong in a system-
specific group, not in comp.lang.c. This message is crossposted to
comp.sys.atari.st.tech, where the discussion belongs.

You don't need to open or close, or assign the RS232c port on the ST.
There's only one*, and it's always turned on.

There are GEMDOS and XBIOS-level calls for reading, writing, and testing
whether a character is waiting to be read. Read the Lattice C manual entries
for Cauxin, Cauxout, Cauxis, Cauxos, Bconin, Bconout, Bconstat.

Port configuration is handled by the XBIOS function Rsconf.

With most C compilers, you must #include <osbind.h> to get the macros
needed to use these OS functions.

--
* The Mega STE and TT030 have more ports. For details on how to use them,
watch upcoming issues of Atari Explorer magazine.

Since posting this yesterday I received from Eric Rosenquist, via email,
the following message:

John:

I saw your Usenet posting about the "Transmit" problem. For some
reason, msgs I post via our news server never seem to go anywhere so
I'm replying via email.

Your problem can be solved simply by keeping your file transfer buffer
set at 31K or less. STalker makes a temp copy of the scrap file
(since another app may create a new one while STalker is "pasting"),
and in 3.01 I made a change from using a local 1K buffer to the using
the full transfer buffer. Unfortunately I had a sign-extension bug in
the code that caused it to fail (it creates an empty file).

Please post this to Usenet for me in case others are having the same
problem.

Eric

463. Hard disk help needed

Newsgroup: comp.sys.atari.st.tech
Date: 1992-01-31 19:17:44 UTC
From: ultron@csd4.csd.uwm.edu
Message-ID: <1992Jan31.191744.1631@uwm.edu>
Source record: 45812

I just got a hard disk unit second hand. It came with some format and partition utilities, but no documentation. When I got it, it had a Spectre partition. I couldn't find a way to change that partition to an ST one, so I reformatted the disk. I need some help in determining what are the best values to enter for some of the format parameters (to get the optimum performance out of the system).

The system has the following components:

Wren I SCSI drive (model #9415-5 77730603)
Adaptac ACB-4000 controller
BMS 103 host adaptor

The format and partition program require values for the following parameters:

Heads 5
Cylinders 697
Interleave 1 ?
Reduced Write 698 ?
Write Pre-comp 400 ?
Landing Zone 4 ?
Step Pulse Rate 2 ?
Reserved Tracks 10 ?
Map Bad Sectors Y
Removable Drive N

I need help in determining the values for the fields with a "?" after them. I was able to format and partition the disk with another program. It did not request as many values. The values I used were:

Heads 5
Cylinders 697
Write Pre-comp 400
Reduced Write <nothing>
Reserved Tracks <nothing>

I'm not sure if the fields I left blank were assigned defaults or not. I was able to successfully format, partition and use the hard drive with these values, but I am unsure if these are best values to use (I know the head and cylinder count are correct).

Any knowledgable help would be appreciated.

> Pretty cool really. I actually don't mind backing up these days. It gives
> me a warm, fuzzy feeling of security too!

Pretty cool really - on an ST, yes. I've used it for 2 years.
Now for the question: Is there any PD/shareware backup tool
supporting this high-density drive of my TT?
The description of The Vault tells, that it will use any format
TOS will support if you use preformatted disks but that doesn't work for HD.

Thanks in advance, Paddy

> [about an Fdup/Fforce/Fclose bug in TOS]

What's happening here (I think) is that the "standard" handles in TOS are literally just aliases for real handles, i.e. in
Fforce(1, foo);
bar = Fdup(foo);
Fclose(foo);
Fclose(bar);
you're closing the same file handle twice.

> Is this still one more bug like the Malloc-bug that will
> never be fixed by Atari because everybody relies on it ?

I can't imagine why anyone would "rely" on such a bug (:-)) although any solution adopted by Atari will obviously have to accomodate the various work-arounds that exist for it.

> Is it fixed in KAOS-TOS?

I don't know about KAOS-TOS, but it's fixed in MiNT (and I've never run across a program that broke because this bug was fixed).

> are MiNTshel, lpd, and MGR.

The ttyname() function in the library used to construct tcsh only works if the tty has a name in u:\dev; it crashes if the tty has a name in u:\pipe (e.g. if it's a pseudo-tty).

I think this can be worked around by creating symbolic links from u:\dev to u:\pipe for as many pseudo-terminals as you are likely to start up with (e.g., assuming that MGR's terminals are called 'ptyaa' 'ptyab' etc., try
sln u:\pipe\ptyaa u:\dev\ptyaa
sln u:\pipe\ptyab u:\dev\ptyab
and so on in your mint.cnf file.

As for the crash on exiting MiNT; that always happens when you leave MiNT with some process still alive. It'll be fixed in 0.93; for now, kill all processes manually before leaving MiNT.

469. Re: Memory hogging in MiNT 0.92

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-01 01:04:18 UTC
From: bigham@acpub.duke.edu
Message-ID: <1084@news.duke.edu>
Source record: 45820

From the Holy Book of <1992Jan29.184548.775@uwovax.uwo.ca>
as spake by 7103_2622@uwovax.uwo.ca (Eric Smith) :

[description of Bjarne Pohler's memory problem deleted]

>Are you sure that the memory is really gone, or is it just fragmented?
>That is, it's quite possible that the largest block of memory in the
>system is now 300K smaller, but there's a 299K block of memory just
>above or below it (the other 1K having been allocated by MiNT for
>data structures while gcc was running).

I dunno. I started wondering when I couldn't run the following command:

zoo xp lessbin.zoo less.man | less

more than once in a row from MiNTshel. I kept an eye on the CTRL-ALT-F5 memory
dump and found that it nearly _tripled_ in length after executing this command.
And if I'm interpreting the dump correctly, the mintshel process had eaten
nearly 270K in the process -- not at all negligible on a 1MB machine. Exiting
after this always led to the following error:

pid 0 (MiNT): assert(`f->links==0') failed at line 590 of filesys.c

It may have something to do with the size of the file I was reading; I have
extracted and read smaller files in this manner with no problem.

I've been running into all sorts of instabilities lately. First MiNT, now these:

- The handling of #pragma idempotent is apparently overly simplistic. In the code fragment:

```
#include <types.h>
#include "types.h"
```

the types.h file in the current directory will not be included.

- While compiling GNU Bison, cc returned a 'Too many arguments' error when it tried to link all the object files together. I couldn't find the upper limit in the documentation -- anyone know what it is? [And yes, I know about the -f flag to ld; that's what I ended up using.]

[Oh, and while I'm here, add my vote to those in favor of the source being released.]

> (Patterson@vfovax.dec.com)
>

Well, what do you think would happen if your DA changes the trap vector
to an address inside the memory it has allocated, and when someone changes
resolution the DA is removed from memory and loaded again?? The trap vector
would point to an address which would very probably NOT be the same position
in the same DA! Of course you could steal the trap vector again, but what
happens before the DA loads again? And if you use the trap vector as usually
by executing your own routine and then jump to the old address again you
would jump to an invalid address...
There may be other conflicts that such an action could cause, but these are
the ones that prevented me so far from doing it! :)

This is a sign that some process was still active (or perhaps suspended)
when you tried to exit MiNT (it's also a bug, but that's another matter :-).
Try doing a "ps" to see if somebody (probably less) has gotten themselves
hung up.

Steve Selick (be824@cleveland.Freenet.Edu) wrote:

> I a looking for the byte in the tos 1.4 header that tells the machine what
> nationality it [s

Try this:

```
int cntry;
static char *TosCntry[]=
{
"USA","FRG","FRA","UK" ,"SPA","ITA","SWE",
"SWF","SWG","TUR","FIN","NOR","DEN","SAU","HOL"
};

cntry = (syshdr->os_palmode)>>1;

printf("Country is %s\n",cntry<sizeof(TosCntry)(sizeof(char*) ?
TosCntry[cntry] : "unknown");
```

syshdr is a pointer to the system header (just where TOS version
number and the nationality byte are).
Hope this is useful...

I don't find this surprising, and I'm not persuaded that it is a bug.

It seems to me that once the existence of anything.h is documented,
that name belongs to the compiler and ought not to be used, EVEN IF YOU
ARE NOT ACTUALLY INCLUDING THE FILE. (Reason for the emphasis: Many
library .h files include others, and you may not be aware of it.)

While 1.33i is not an ANSI compiler, my (admittedly outdated) references
specifically warn that ANSI does not mandate that "" and <> be handled
differently by the compiler. In that case, it is perfectly reasonable to
assume that "types.h" and <types.h> refer to the same file.

> - While compiling GNU Bison, cc returned a 'Too many arguments' error when it

> -f flag to ld; that's what I ended up using.]

I don't know what the upper limit is, and considering that the library
supports a workable method of passing extended arguments, I can't imagine
why there should be an upper limit at all. I've run into this problem too,
when compiling the Conroy/Braner/Schumacher/Stanley version of MicroEMACS;
my solution was to write a makefile that calls on the ar utility to put
the object files into a library:

```
#
# Makefile for compiling MicroEMACS (edit.ttp) with Sozobon C 1.33i
#
# cc doesn't like long command lines, so we use an intermediate step,
# archiving all the .o files into a library.
#
#
```

```
OBJ = buffer.o display.o files.o \
line.o random.o term.o word.o cursor.o emacs.o \
help.o linea.o search.o window.o

edit.ttp: uelib.a
$(ECHO) Linking and creating edit.ttp
cc -o edit.ttp uelib.a
edit ue.doc

uelib.a: $(OBJ)
$(ECHO) Creating a library out of the .o files
ar -rv uelib.a $?
```

> [Oh, and while I'm here, add my vote to those in favor of the source being
> released.]

You bet. Me, too.

478. HELP with linea calls in C

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-01 21:08:24 UTC
From: cscon105@uoft02.utoledo.edu
Message-ID: <1992Feb1.160825.6006@uoft02.utoledo.edu>
Source record: 45691

I am using Mark Williams C, and I am having trouble with sprites on
the linead() call. MWC doesn't come with much of any linea documentation.
I do have Atari ST internals, but it describes everything in assembly,
which makes it difficult to see exactly how to implement the call
in C.

Ideally, I would like to see a very short C program which puts a sprite
on the screen, but I could handle wading through a huge program which
uses linead calls.

I would be very grateful if anyone could send me some code, or point me
in the direction of where I could acquire some example code.

Thanks, Bryan Kruzynski
cscon105@uoft02.utoledo.edu

It shouldn't make any difference if there's a types.h in the standard
include directory; include files in the current working directory
shouldn't be ignored. Lattice C has this same problem. It's easy to
say "don't do XXX," but that doesn't work for people who already have Y
thousand lines of code written in what they thought was perfectly
standard code. How am I supposed to know not to use "osbind.h" when
I'm writing code on a PC, for example?

It may be reasonable from a textbook standpoint, but it's damned annoying.

This sounds like the same problem I have with trying to run tcsh under
bgacc. Eric Smith has sent me email regarding this and has tracked down
the bug. It has to do with a bug in the MiNT libraries. Tcsh tries to
get the ttyname and the library call screws up for pseudo-ttys. A null
pointer is returned and then dereferenced, bombing the program. Eric
told me that he will be releasing a fixed version of tcsh after he does
some more testing on it. (I assume he will update the libraries soon as
well.)

If this is a SCSI drive, there is no nead for the MFM Adaptec controler, all you nead is the BMS host adapter, but is this not a very old version, old host adapters can have problems with the STE..

Well Problems with faulty DMA chips, well a friend ended up getting a faulty STE with the fauty DMA chip, this ended up corrupting a lot of my directory.

But there is no easy way to find out, what we were told here that some machines will work with one drive but not another,
so it would be best to get it tested on a number of drives,
or may be a dealer knows the version of the DMA chip that is faulty,
one thing I would like to see Atari come clean on this and let people know what chips are faulty..

You could bye a STE and some 2 years later get a hard drive and then find that is does not work, so come on Atari why not support your users,
and fix all these faulty machines that are out there.

I think I know why they don't, its because only some 10% of machines will end up with hard drives attached to them, but is this not a nasty and cheap way of treating customers..

Come on Atari you have made the mistake you must pay for it, warranty does not come onto it, that is just a get out..

Well here in NZ, they can't get away with it, we have a sale of goods
ack, this means as its there fault they must pay..

And its allready worked for me..

483. Screen problems and bus errors....

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-02 08:27:54 UTC
From: "J.J. Lehett" <JJL101@psuvm.psu.edu>
Message-ID: <92033.032754JJL101@psuvm.psu.edu>
Source record: 45834

I recently installed a Zubair 3d 4 meg RAM upgrade on my 1040 ST.
It seems to be working fine, however I get some odd problems and was wondering
if it is in relation to this.
Often I will get assorted pixels on the screen (not many, but differing
amounts) blinking, and immediately the system locks up completely. Also
sometimes prior to a lock up I get bus error bombs. Does this sound like
it has to do with the upgrade board? (pingrid not in perfectly etc?) or
something else? I know the pingrid board was ok when I put it in, since I
did have some trouble getting it seated fine, but I did, and all ram tests
check out ok.
Most often when this happens , a simple warm reboot will be eliminate
the problem. Sometimes I need to give the machine a SLIGHT 'hit' to get it
back working, but the reasons are different than the normal ones when the
pingrid popped out a bit (ie. black screen or MANY bombs indicate bad
pingrid seating)...
This problem occurs with intermiittent frequency and just wanted to know
if anyone is familiar with this so I can zero on on what the problem is
instead of assuming its the pingrid, since I do think its in fine.

Hello Benedict Eric,
there are some sources available for such an Network:
- 68000'er, now ST Magazin, published some network-software a few years ago.
Pascal Sources are available on a 'Sonderdisk'.
- ST Computer also published a MIDI - Connection - Accessory (without
network-driver, you haven't any network drives!)

Furthermore, there is a MIDI-network (p) by 'Quazar', it is 198,--.

Hope it helps,
Thomas

I never use the virtual screen or clipboard options of STalker, so I haven't experienced the same problem as you yet. I've noticed other strange occurences though...like going to the autodialer, selecting load (.DLR) and choosing a new .DLR file. The window will redraw, but with the same old numbers! If I then close the window with OK and reopen it right away, the new numbers are there. Weird. I've informed Gribnif of my problems, you should do the same with yours. They're VERY helpful.

I think you should change that statement, CHKDISK3 is Copyright Atari,
so how can it be PD, it has only been released to Developers, but there was
a hickup some time back and it did get uploaded to GEnie by mistake..

488. Mega STE Hard drives / SCSI.

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-03 10:42:00 UTC
From: elendir@inf.enst.fr
Message-ID: <886@clbull.frcl.bull.fr>
Source record: 45758

|>Some one told me it was only the TT that had a SCSI Port, and the Mega
|>STE Did not have one, but I stand to be coreected on that...??

Well, both have a SCSI bus. The difference is the TT has a SCSI connector;
that way you can connect SCSI devices such as Syquests or scanners very
easily.
However, the Mega STE has an internal ACSI to SCSI card, but the SCSI bus
is connected to the hard disk and no output is provided. But it's very easy
to replace the built-in cable by one of your own design, allowing you to
access the SCSI bus.

Another difference between the TT and the Mega-STE is : The TT has a true
SCSI bus, handled by a NCR chip. As such, the TT-Tos includes primitives
for SCSI protocol. The SCSI chip can make DMA on fast-RAM, whereas standard
ACSI bus cannot and is restricted to ST-Ram.
Thus, the TT can handle as much as 8 unities on ACSI bus, and 8 on SCSI bus;
the Mega-STE has the usual limitation of 8.

Hope it'll be useful.

Enjoy.

ATARI is on the way to help you. Last week I upgraded a MegaSTE to 4MB and while
switching it on the first time it stated

AHDI 5.0 (c) ATARI Corp. XX.12.1991

device 1: Segate 157N
device 2: not responding

BOOTLOADED

What does that mean? AHDI is shipping in Germany and like others told on c.s.a.s
this is the driver used on the ST-BOOK with an IDE harddisk.
So the controllers for the IDE drives shouldn't be far away.

In article <6349@uqcspe.cs.uq.oz.au>, warwick@cs.uq.oz.au (Warwick Allison) writes:

|>Can the printer-port speed be increased by software or hardware?

The handling of the printer port is basically done by interrupts. The centronics handshake is asynchronous, based on the protocol Busy/Ack. The hardware signals BUSY and ACK are connected to the MFP 68901. Hardware speed-up of the port is quite impossible (or you have to develop a buffer card to insert between your ST and your printer). Software speed-up is possible, I think. However, you would have to re-write all the interrupt handlers; fairly interesting job. BTW, some programs have their own centronics routines (Script 2). I can provide some informations, if you are somewhat ready to do it.

|>Does the TT port promise to be any faster? (I can't imaging 24Kps
|>is limited by the CPU).

I have a standard BJ 10e, and a TT. I tried once a Calamus print, it worked fine, without any "idle period". That is no surprise. You can expect the interface to run twice or thrice faster. However, this is POTENTIAL, I cannot tell what is the true speed really achieved.

Enjoy.

|> being PD, I got it from a friend, but he had no manual).

GFA-BASIC IS NOT PD
GFA-BASIC IS NOT PD
GFA-BASIC IS NOT PD

even if START had published some time ago.
This is the way you KILL ST-SOFTWARE.

GFA is still making ads in Germany but they have discontinued to develope
software for the ST (especilly their basic).

Frank Ostrofski started with TURBO-Basic published as a Listing in Happy-Computer
(I think 1984 or 85). Being discovered by GfA Systemtechnik he wrote GfA-Basic
for the ST but Rev 3.6 for the TT is the last one.

The didn't even come to the ATARI-fair at DUESSELDORF in 1991 only their GFA-BASIC
new distributor (RICHTER, they only steal your MF44 media and aren't serious at
all).

492. MiNT 0.92 (again)#

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-03 11:29:18 UTC
From: kdv_521@eimoni.tuwien.ac.at
Message-ID: <1992Feb3.112918.2016@email.tuwien.ac.at>
Source record: 45840

Under MiNT 0.92, when I use Pmsg with mode 2 in one of my programs, the writer, when he gets the reply from the reader, doesn't seem to get the msg1 and msg2 fields of the reader (in the first place) correctly. Actually he gets the fields he sent himself. I'm not sure if this is not what it's supposed to do, at least I thought the writer should get the message the reader sends back! :)

Also, I'm trying to write a program that communicates with many clients via FIFOs, but I haven't found out yet a good solution to how data should be sent between the processes. Currently I use the following method:
First the master process is started and waits for messages from a client. When a client sends a message to the agreed message box, the master sends a unique number for the client, and creates FIFO_IN.xxx and FIFO_OUT.xxx which the client can then open using this number. But how do I send data now from the client to the master? And how will the master know if there is data waiting in the FIFO? Usually the master gets a '0' from Finstat if I use Fputchar or Fwrite from the client...

I know this is a pretty weird and boring posting, but I would really appreciate it if somone helped me... :)

> bigham@hercules.acpub.duke.edu writes ...]

> > [Oh, and while I'm here, add my vote to those in favor of the source being
> > released.]

>You bet. Me, too.

Just for the record: I lost a time ago the source for ld from sozobon, and
decided to re-write it. (Yes, i do know about ftp sites).

The result is an ld which
1) can handle long command lines (using any dlibs supported mechanism)
2) is (quite a bit) faster than the standard sozobon ld
3) implements (yet another) format for using long identifier names. So
more than 8 characters are significant.
4) Has unsupported options for linking really big files. (and will produce
bombs on this.)

This source is available on request for anybody who wants to incorporate
this ld in a bigger package. (as changes to support the changed .o format
are also available). I am not going to redistribute it to a wide audience
as it is, because it will again give more confusion.

>since I was thinking about adding a 5 1/4 inch drive, and if it could be
>HD that would be even better. (But not as good as 1.44 3 1/2!! But I
>can't afford that.)

In a German ST-mag (called "ST Computer") there once was an article how to
connect AND USE HD-Drives at a normal ST. It requires a speedup of the
wd1772 and some other small modifications plus a special format program
to do HD-formatting. The latter is now included in many German ST copy-
and format programs...
If there is enough interest from all readers of this group, I'll try and
translate the article and send it to atari.archive (with corresponding
formatter)... but since the article is (I think) 4-5 pages, it will last
a few days to translate, so all people who wish to have it translated
please mail me! (If someone has already translated it, mail me too!!!).

>will recognize that? - I guess it should be added to the MiNTlibs...)

What about switching bash into UNIXMODE:
UNIXMODE=/.,rCLAHdbx ; export UNIXMODE
and after that create a ".dir" file in all the directories along your
PATH containing lines like the following:

```
ls ls.ttp A
gcc gcc.ttp A
g++ g++.ttp A
awk awk.ttp A
...
```

(These lines mean that during UNIXMODE ls.ttp is logically replaced by ls,
gcc.ttp by gcc, g++.ttp by g++ and awk.ttp by awk ... These replacements
are only UNIXMODE internal! The programs won't be renamed or changed by
this feature)
If you make these changes in your system, bash will promptly execute your
programs without yourself having to enter its extension!

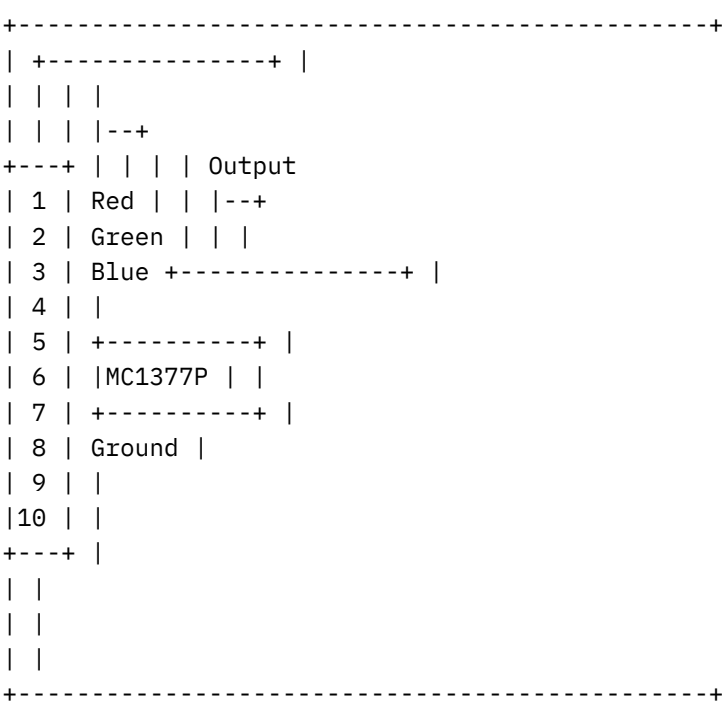
497. Atari RGB Converter

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-03 15:21:07 UTC
From: malay@sae.com
Message-ID: <1992Feb3.152107.7244@sae.com>
Source record: 45744

I recently got a hold of the Atari RGB converter (Part #C070491 (163T)). This apparently is the part that is used in the STFM models. I don't have any docs for this thing but I would like to know what the pins on the 10-pin connector are and where they are supposed to be connected to?

Here is a crude sketch of the thing and those lines that I've identified:



I'm not sure where the Horiz and Vert Sync, Audio lines go ?? Also there is an additional wire hanging off the underside of the PCB which I believe is the power line (+12V) with ground. Has anybody ever poked around with this thing or does anybody have the Atari Service Manual that describes these ten lines??

Bob Malay

This is an MFM drive, not a SCSI drive. Makes an excellent boat anchor if
you ever decommission it.

> Adaptac ACB-4000 controller

This accepts SCSI signals and converts output to MFM.

> BMS 103 host adaptor

Atari DMA to SCSI.

>
> The format and partition program require values for the following parameters:
>
> Heads 5
> Cylinders 697
> Interleave 1 ?

The interleave value can be 1 or 2; best results probably with 1.

> Reduced Write 698 ?

Any value greater than 697.

> Write Pre-comp 400 ?

Use 128.

> Landing Zone 4 ?

Any value greater than 697.

> Step Pulse Rate 2 ?

Use 4.

> Reserved Tracks 10 ?

Control Data folks told me to ignore this, but 10 is probably OK.

> Map Bad Sectors Y
> Removable Drive N

In general, whenever you run into a problem like this, pick up the telephone and (in the USA, at least) dial 1-800-555-1212 and ask the directory assistance folks for a toll-free telephone number for manufacturer. Most of the time you'll get lucky. If they don't have one, look on the drive for the maker's city/state and try that. It usually doesn't take more than 10 minutes to track down a technician who can quote the numbers out of a manual.

I got the above numbers from a Control Data technician when I installed my Wren I (currently in retirement). Since then, CDC has renamed its disk drive operation Imprimus and sold it to Seagate, so they're probably the best place to call if you have further problems.

Lattice C, version 5.06.02, provides an 'auto-detecting' start-up module,
this allows the program to determine what kind of program it is:

AUTO *.prg

GEM *.prg / *.app
*.acc

TOS *.tos / *.ttp

I will look at the *.s module Lattice provide, I cannot remember how they
implement this :-).

Ian.

500. Rack mounting a floppy

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-03 16:27:12 UTC
From: krieg@ct19.med.ge.com
Message-ID: <1992Feb3.162712.10704@mr.med.ge.com>
Source record: 45746

I want to mount my 2 floppy drives inside the case my hard drive is installed in. It has room to rack mount 2 drives. What extra hardware would I need once I've peeled the case off of the Atari floppies. Is there a rack mount kit available? My hard disk is mounted in a PC swivel top case. It has several power supply cables that are unused. Can an Atari floppy be powered by these?

501. Memory protection questions

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-03 16:28:29 UTC
From: sourada@iastate.edu
Message-ID: <sourada.697134509@vincent1.iastate.edu>
Source record: 45745

I would like to know what kinds of memory protection are implemented in the various computers in the ST/TT line.

What I need to know about them is: What are the protocols about them (what the programmer should do even if the hardware doesn't mandate it)? What does the hardware mandate?

I would also like to know what the general protocol is for retaining compatibility with future changes, such as multitasking, etc.

Speicifically, I need to know if the operating system's variables are available to anything on the system at any time (as they are in the 1040STe and earlier, as long as the program is in supervisor mode.)

Thanks,
Steven Ourada

Hello Trevor,

be carefull with CHKDISK3. It is not PD as Normen Kowalewsky from
Atari-Germany wrote a few weeks ago, because it is a
developer-pre-version.

From the documentation (quoted somewere else):

ATARI CHKDISK3 DOCUMENTATION
April 22, 1990

WARNING !! CHKDISK3 has not been through heavy testing and you use this
programm at your own risk. Proceed with caution. Back up your disk (especially
hard disks) BEFORE yuo use CHKDISK3. This is a powerful tool which can fix
damaged disks, but, if it's miused, it can also damage goog disks.

The Atari CHKDISK3 program is a utility that analyzes a disk's file structure
and does all of the necessary fixes. Before yuo use the programm, you should
have somme basic knowledge about the disk and file structure.

Tschau... Ralf

I've used MWC very recently on a 1040 STe with 2 megs and a SCSI hard drive. Seemed just fine, and it's quite a nice compiler.

In article <H.srFke2UinTo@pingu.saar.sub.org>, edgar@pingu.saar.sub.org (Edgar Greuter) writes:
> [about an Fdup/Fforce/Fclose bug in TOS]

I don't know about what Eric said (about closing the same file twice), but there are TONS of known bugs in GEMDOS's handling of dup & force. Don't expect too much from them. There is a subset of operations that work, and everything else is misty. The guy who wrote GEMDOS didn't know anything about handles and what they're for, and that hasn't yet been fixed in any (released) GEMDOS.

What follows is the kind of stuff you should be doing, e.g. to redirect both stdin and stdout, and un-do it when you're done. I think it works under GEMDOS, and it certainly works under MiNT:

```
/* copy existing meanings of stdin and stdout for later restore */
old_in = Fdup(0);
old_out = Fdup(1);

/* open & Fforce the redirection files */
new_in = Fopen(new_stdin_file,0);
Fforce(0,new_in);
new_out = Fcreate(new_stdout_file,1);
Fforce(1,new_out);

/* do stuff (like Pexec) now that we're redirected */

/* un-do the redirection */

Fforce(0,old_in);
Fforce(1,old_out);

/* close all the leftover handles */
Fclose(old_in);
Fclose(new_in);
Fclose(old_out);
Fclose(new_out);
```

Like I said, I think this even works under GEMDOS, but not two levels deep. Also, I'm sure it bombs under GEMDOS if, for example, you move the Fclose of new_out to, say, right after Fforce(1,new_out). Such an Fclose call should be harmless because you're done with new_out as a handle, but in fact it screws GEMDOS up. Also note that some of the Fclose calls at the end will return EINTRN rather than 0 for success, but it still works.

510. Re: Memory hogging in MiNT 0.92

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-04 01:38:23 UTC
From: apratt@atari.uucp
Message-ID: <1992Feb4.013823.3246@atari.uucp>
Source record: 45756

Of course, the original problem referring to "cat | cat | cat | cat ..."
brings up another point: the timing of program launching is critical in
this case, because if a copy of "cat" tries to start up before the previous
copy has done its Mshrink call, there won't be any memory available.
If you run mintshel under limit this won't happen -- that is, if you start
mintshel like this:

limit -M 512k mintshel

then each 'cat' will only start out with at most 512KB, and you can get two
of them per megabyte that's free (barring fragmentation).

MiNT lacks a call that says "limit my children without limiting me," so
you're stuck with limiting minshel. If you run the pipeline as
"limit cat | limit cat | limit cat" you'll lose because "limit" itself
isn't limited. And so on.

Steve Selick (be824@cleveland.Freenet.Edu) wrote:

|I a looking for the byte in the tos 1.4 header that tells the machine what
|nationality it [s

The following should do it.
I wonder if we should use "real" European abbreviations for the
names of the country codes. Does anyone know standard abbreviations
for all the countries listed below?

snip-8<--

```
/*
With some versions of the Atari hard disk driver, the OS header was
copied into RAM by the driver so that it could find the date a system
was built in order to add OS pool. Unfortunately, the way it copied
the header obliterated the `os_conf' word in the RAM OS header. The
`os_conf' word tells you which country the TOS version was built for.
If you need to find out what country your program is running in, you
must check the ROM copy of the OS header. You can get the address of
the ROM os header by dereferencing the pointer `os_beg' in the RAM OS
header, and you can get the address of the RAM OS header from the
system variable `_sysbase', located at 0x4f2.

This is the structure of the OS header (it is also described in the
Hitchhiker's Guide to the BIOS, on page 55, in the section entitled
"PUNTAES and the OS Header (Gory Details)"):
*/
typedef struct _osheader { /* offset description */
/* --- ------------------------------- */
unsigned short os_entry; /* $00 BRA to reset handler */
unsigned short os_version; /* $02 TOS version number */
void *reseth; /* $04 -> reset handler */
struct _osheader *os_beg; /* $08 -> base of OS */
void *os_end; /* $0c -> end BIOS/GEMDOS/VDI ram usage */
void *os_rsv1; /* $10 << unused, reserved >> */
void *os_magic; /* $14 -> GEM memory usage parm. block */
long os_date; /* $18 Date of system build ($MMDDYYYY) */
unsigned short os_conf; /* $1c OS configuration bits */
unsigned short os_dosdate; /* $1e DOS-format date of system build */
/* The next three fields are only available in TOS versions 1.2 and greater */
void **p_root; /* $20 -> base of OS pool */
char **pkbshift; /* $24 -> keyboard shift state variable */
void **p_run; /* $28 -> GEMDOS PID of current process */
void *p_rsv2; /* $2c << unused, reserved >> */
```

```
} OSHEADER;

/*
The following C code demonstrates how to correctly get the country code
from the ROM OS header:

Note that Lattice C defines UK as GBR (Great Britain, I suppose...
is UK a politically incorrect abbreviation? :)
*/
#define USA 0 /* United States of America */
#define FRG 1 /* Federal Republic of Germany */
#define FRA 2 /* France */
#define UK 3 /* United Kingdom */
#define SPA 4 /* Spain */
#define ITA 5 /* Italy */
#define SWE 6 /* Sweden */
#define SWF 7 /* Switzerland (French) */
#define SWG 8 /* Switzerland (German) */
#define TUR 9 /* Turkey */
#define FIN 10 /* Finland */
#define NOR 11 /* Norway */
#define DEN 12 /* Denmark */
#define SAU 13 /* Saudi Arabia */
#define HOL 14 /* Holland */

#define SYSBASE ((OSHEADER **)(0x4f2L))

char *TOS_country(void)
{
/* Return a string identifying the country of the TOS version
* under which the caller is running.
* (based on code written 890718 kbad)
*/
static char *countrytext[] = {
"USA","FRG","FRA","UK", "SPA","ITA","SWE",
"SWG","SWG","TUR","FIN","NOR","DEN","SAU","HOL"
};

/* Get the RAM OS header, then use it to get at the "real"
* OS header, since the RAM one doesn't contain a valid
* os_conf word with some hard disk drivers.
*
* The low bit of the os_conf word is the palmode flag,
* so it must be shifted right to get the country index.
*/
void *savestack = (void *)Super(0L);
OSHEADER *osheader = *SYSBASE;
Super(savestack);
osheader = osheader->os_beg;
return countrytext[(osheader->os_conf >> 1)];
}

Only boring for people who don't play with this kind of thing.

My guess is that you need to turn buffering off on the FIFOs, probably by
using setbuf() if you are using fopen, etc.

Warwick.

From: warwick@cs.uq.oz.au
Message-ID: <6499@uqcspe.cs.uq.oz.au>
Source record: 45754

CrackArt can output in DEGAS Elite, Neochrome, and a dozen other format.

But the default, .CA1 files are nice and small.

Provided with CrackArt is assembler source for decompressing and compressing
such files.

But I'm only slightly more proficient at Assembler than I am at German.

If the code was in C with German comments, or in Assembler with English
comments, I could work it out, but alas, it's Assembler with German comments.

Has anyone managed to integrate this into a C call, or converted it to C?

Just trying to save myself a lot of work,
Warwick

ps. Impressive program!

516. isatty()

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-04 05:24:12 UTC
From: ant@mks.com
Message-ID: <1992Feb4.052412.16332@mks.com>
Source record: 45753

I think I just stumbled across a case where the offical isatty() function
(using Fseek instead of Fdatime) fails.

Consider the following isatty() (similar to Dlibs 1.2)

```
#include <sys\types.h>
#include <sys\osbind.h>

int
isatty(handle)
int handle;
{
if ((off_t) 0 < (off_t) Fseek(1L, handle, 1)) {
/* Fseek moved and implies a proper file. */
Fseek(-1L, handle, 1);
return (0);
}
/* Fseek failed to move beyond 0 and implies a character device. */
return (1);
}
```

This will work most of the time except when the handle being checked is
attacted to a recently created file that is empty. Fseek() will not
move because the file is 0 in length and the implication that handle
represents a character device will be incorrect.

I don't know how isatty() was done with Fdatime(), but from reading the
TOS 1.4 notes Fdatime() now returns EIHNDL when a character device is
passed. For TOS 1.4 or better the following, I should think would work:
^^^^^^^^^^^^^^^^

```
int
isatty(handle)
int handle;
{
short x[2];
return (EIHNDL == Fdatime(&x, handle, 0));
}
```

The problem is what to do for versions of TOS before 1.4.

-ant

PS. I stumbled onto this when I tried to use fwrite() from the Dlibs 1.2
library to save text to a file only to have it appear on the screen. It
seems that fopen() would do an isatty() check right after opening a file
or device and end up always setting IODEV flag since isatty() would always

return true.

> are much quicker than any RS232 could be...
> Read ya, Phil...

Well, both DOS2DOS and CrossDos are commercial programs, not PD. There are some PD programs that will do the job. MSH 1.30 or MultiDos would work. Well, I'm not sure they could handle some of the extended format disks that many ST users (like me) use. Then again, they might. I know Dos2Dos had no trouble reading/writing 82 track/10 sector disks from my ST. I just can't say about the others. Both MSH and MultiDos can be had by anonymous ftp from ab20.larc.nasa.gov, MSH is also included in the demo version of the IBeM software PC emulator on ab20.larc.nasa.gov
cd to amiga, then utilities, then disk, and you will find:

msh-1.30.zoo and multidos.lzh
You can find ibem120.lzh in either incoming/amiga or in amiga/demos/commercial - I'm not quite sure on that one.

I'm a little nervous about posting anything to do with the Amiga in here, but there is a valid reason I think. And it isn't a flame, kind of rare to make mention of the Amiga in here without flames breaking out, heh. It seems pretty silly to me. They are both good machines and I really don't understand why everyone isn't off enjoying their own computer, rather than attacking what the other guy bought. The usual excuse is that they are 'correcting misinformation'. Trouble is, they usually add some of their own misinformation in the process. And on and on it goes, where is stops, nobody knows (although most of us hope its soon, heh). Anyway, hope I didn't post any misinformation, or off we go again, heh. At least I didn't cross-post it into the Amiga group. Thats how the worst flame wars get going from what I've seen. Anyway, sorry, couldn't resist throwing in a comment about the flames. Don't think I've ever posted anything about it before and don't plan to again. Later.. Mark.....

It's not entirely correct. To access os_palmode you have
to follow once the os->beg pointer (this is the pointer at offset 8).

So add: syshdr = syshdr->os_beg;
before cntry = ...

Even if you don't understand why, believe me. You can find details
in the Rainbow TOS Release Notes or in the new edition of the
'Atari ST/STE/TT Profibuch' (Sybex Germany).

As far as I know, it is a VERY BAD hack which look into the negative
line a variables to find out if the mouse visible. It will certainly
break on new TOS versions, remote shells and replacement desktops.

521. Auto-Detection...

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-04 12:22:16 UTC
From: cs90ijr@brunel.ac.uk
Message-ID: <3447@mercury.brunel.ac.uk>
Source record: 45748

I have had a look at Alex Kiernan's Lattice C 5 startup module, and my trusty 'Atari ST Internals' :-).

At the start of your program, if A0 is non-zero then the program is a desk accessory.

Otherwise, place a magic-number in register D0, call GEM function appl_init(), and test D0 for the magic-number. If D0 is unchanged then GEM has not been initialised, since TOS initialises the TRAP #2 vector to point to an RTE instruction.

If D0 is unchanged (GEM not initialised) then the program is running in the AUTO folder.

If D0 is changed then GEM has been initialised and the program is either a GEM *.prg / *.app or TOS *.tos / *.ttp. To distinguish between GEM and TOS simply check the Line-A ld_m_hid_ct (mouse hide count) variable, if zero then the Mouse is visible - and the program is running under GEM, else the program is running under TOS.

Ok, so the solution is crude, and uses _UNDOCUMENTED_ features. Is there a better (_documented_) method? E-mail me!!! I will summarise to the net!

Lattice C provides auto-detection, and since auto-detection has been discussed on this newsgroup previously, there is obviously a need for TOS to provide the programmer with this information. So Atari (Allan/Ken) how about...

. unused basepage element
. system variable ???
. cookie jar ???
. new TOS function 'WhatAmI()'

How does MACCEL know the difference between being run from the AUTO folder/desktop???

Atari are making *valid* rules - for example don't use the Line-A or undocumented features. Programmers should be encouraging Atari to create an OS which doesn't mean we _have_ to use undocumented features.

Ian.

Something I think we shoudl add to the MiNT wish-list is shared text. Of
coarse, MiNT would have to hold extra info about processes, such as the full
filename and timestamp of the executable, and a usage count, but it should
be possible.

This would be a real boon on an OS with no swapping or paging.

>
>MiNT lacks a call that says "limit my children without limiting me," so

Steve

PS. I'm looking into the possibility of adding at least memory protection to
MiNT on the TT (maybe swapping and demand paging would be possible too). I
have two problems, however:-

(1) The Motorola docs on the 68030 and 68851 (The PMMU of which the 68030's
is a sub-set) are as clear as mud!

(2) The Atari docs (TT release notes) don't really mention the PMMU type
stuff.

I would love to see an example of the way the PMMU data strcures are set up.

The following is a letter a friend wrote to me about his computer.
He seems to be having trouble with his disk drive controller chip
or I guess he could have a bad trace, anyway see what you folks can
come up with please. E-mail me and I will see that he gets your
informantion.

1040STF

The only thing I wanted to do was install "PC Speed", however...

A little back ground on PC Speed: It is a board mounted (soldered) on
top of the processor. The 1040 has at least three different internal
designs.

Because my 1040's processor is located below the internal drive, The
Atari dealer in Spain suggested I remove the internal drive and
extend the cables to place it outside. This was because of the heat
generated by the drive. During the installation of the processor
jacket (by an AF COM person) [Air Force Communications Tech], a diode
or something was inadvertantly burnt out. I then took my computer to
the certified Atari Servicing agent in Barcelon (ETEC or ELTEC or
something like that). This is were I am at now. The last thing done
was the "fix" by the agent in Barcelona.

In the interum, I have bought an external floppy. I can not get it to
work on my computer. I have tried it out on a friends 1040 and it
does funtion properly.

That is about all. I hope I have given you all the info you need.

Thanks for anything you can do.......

Mikey

I recently used DC FORMAT to format and write an MSDOS boot sector to a
disk so I could copy some ftp'd software from a PC connected to UNIX to my ST.
The files copied fine onto the disk, but when I tryed to access them with
my ST the directory was completely empty. After panicing a bit since the
files also included something mailed to me that I had no other copy of, nor
the address of the sender, I had a look at the disk using a sector editor to
find that the directory was written where the 2nd copy of the FAT should be.
I fixed this by setting the FAT size from 5 clusters to 3. It seems the PC
I was using (a Dell '386 I think) was ignoring the boot sector and using 3
cluster (or is it sector?) FATs.
Although DC FORMAT has always worked before on a wide range of PCs, it
seems that the only way to be sure is to format the disk on the same PC you
will be using the disk with. The ST, however, seems to be able to read any
(non HD) format with ease.
I hope this helps somebody who has had similar problems.

I ran the patch program on my copy of STalker, and while the patch program seemed to work just fine, STalker was completely unusable on my TT. It would freeze on any input from the modem that wasn't a reflection, it wouldn't run scripts, etc. etc. I'm back to 3.00, myself.

528. Help with GFA Basic 3.5?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-04 18:03:50 UTC
From: RIFFEGL@PURCCVM.BITNET
Message-ID: <92035.130350RIFFEGL@PURCCVM.BITNET>
Source record: 45747

I am currently trying to write a simple program in GFA Basic 3.5 to write a file to disk. Here is the source code:

```
cls
a$="a:\menu.inf"
open "o",#1,a$
do
cls
fileselect "a:\*.*","",name$
if name$=""
close #1
stop
else
print "enter name for ",name$,":"
input prgname$
write #1,prgname$,name$
endif
loop
```

The program works fine from the interpreter.
It compiles cleanly but when run, crashes out on the open statement with error 008.
When run with the GFA Basic Run/Only program it seems to run fine but creates an empty menu.inf file.

Any help as to what is happening here and/or how to remedy my woes would be greatly appreciated. I can't find anything in the manual about compiling the open statment or anything else that might help.

> When a client sends a message to the agreed message box, the master sends
> a unique number for the client, and creates FIFO_IN.xxx and FIFO_OUT.xxx
> which the client can then open using this number.

I think it would be better for the master to create a two-way fifo
FIFO.xxx and just use that; otherwise, the client must be the one to
create the FIFO_IN.xxx file (assuming that's the one the client will
be writing to).

Fifos are two way by default (i.e. if you do Fcreate("FIFO.000", 0)
you'll get a two way fifo). The master should do the Fcreate and
then send the fifo number to the client; the client then should do
an Fopen of the file. Now, whatever the client writes to the fifo
the master can read, and vice-versa. Finstat(), Foutstat(), Fselect(),
etc. will all work to check for the presence of data.

Remember: the output of the Fcreate is connected to the input of the Fopen,
and the output of the Fopen is connected to the output of the Fcreate.
This can perhaps cause some confusion (the master is unable to read back
what it just wrote, for example). But if you think of the whole procedure
as being like the connection between a program and a terminal, it will
perhaps be clearer what is happening. Fcreate() creates the terminal,
and the master is like the user: the master's "write" command is like
the user typing on the keyboard, and the master's "read" command is
like the user reading the screen. On the other side, Fopen() establishes
a connection to the terminal so that the client program can read
from the "keyboard" and write to the "screen".

See the source code for the MiNT utilities lpd and lpr for a real
world example (they're in mntutl9s.zoo on atari.archive).

I use MWC on a Mega ST2 with Rainbow TOS (1.4) and a hard drive installed.
Only one problem: DB.PRG doesn't run; it complains that it doesn't recognize
the TOS version. There is a patch program in the public domain that fixes
this.

What is TOS 1.04??? The Atari documentation that came with my Rainbow TOS
chips clearly says the version is 1.4; so does the cute Rainbow in the upper
left hand corner... yet I see lots of people talking about TOS 1.04.

It is fairly NORMAL for focus to vary from one part of the screen to another
(especially on larger screens). Often all you can do is get the best
compromise focus.

Only if the focus is VERY BAD is it a problem.

Hint: try for best focus in a circle around the center about half way to the
edges. Center will be a little fuzzy, edges will be a little fuzzy, but this
will generally give you the best compromise that you can hope for.

Also, flatter faced CRTs need TWO focus adjustments: 1) for static focus, and
2) for dynamic focus. I don't know if the SM144 has this, but without some
dynamic focusing the difference in gun to screen distance as the beam scans the
screen on flat face CRTs makes perfect focus impossible.

It is my understanding that allow CHKDISK3 is copyright Atari, it is freeware and freely distributable. It is on the Atari Canada BBS, which is open to the public. If it is not PD (if someone at Atari states just that) then I'll kill my copy and prompt the local bbs's to kill it too.

543. TT disk drive woes

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-05 04:07:01 UTC
From: genius@sys6626.bison.mb.ca
Message-ID: <euqNFB5w164w@sys6626.bison.mb.ca>
Source record: 45770

I don't know if this is a hardware problem, and it only pops up in this instance, but it's bugging me... how come when I run speed.prg (or whatever), the program that runs the floppy drive and spits out a rpm number, it pops an alert and says 'no drive pulse' or something rather. Why does it say that? Is my drive dead? It seems to work great otherwise.

Also, my PTC1426 monitor is acting flakey. This used to happen alot, but not so much now...The screen will shrink and grow rapidly (compress & come back to normal size about as fast as a vertical hold screw up will jiggle the screen up and down). Sometimes a bit, sometimes alot. A slight tap on the monitor (used to be BANGS) will cure the problem for a few minutes. Before I had a guy 'fix' the monitor, it used to be REAL bad, now it only occurs when the monitor's been on for a LONG time and starts to heat up (alot). The guy said it was a 'cold solder' or something like that, and he just wobbled the main circuit board inside the monitor a bit, and the problem went away. It pops up every once in a while, but never as it did. Is this guy right? Should I send in my monitor for a week to get repaired (no TT for a week???)?

One last thing, there is a little tiny chip in the glass on the front of my PTC1426 monitor...right in the center of the screen. That was there since I bought the comptuer. Is there anything, short of a new monitor, that I can do to cover it up/fix it?

It's in the atari.archive.umich.edu right now at /atari/new/master.zoo should be moving to right directory later.
It's from the German FTP site as the original poster provided, its link is low speed so FTP takes a little bit longer and your system needs to allow longer time for the traffic.

```
>I wonder if we should use "real" European abbreviations for the
>names of the country codes. Does anyone know standard abbreviations
>for all the countries listed below?

Why not use the country prefixes used in the European equivalents
of ZIP codes? This would look like:

#define USA 0 /* United States of America */
#define D 1 /* Federal Republic of Germany */
#define F 2 /* France */
#define GB 3 /* United Kingdom */
#define E 4 /* Spain */
#define I 5 /* Italy */
#define S 6 /* Sweden */
#define CH 7 /* Switzerland (French) */ (here we have a
#define CH 8 /* Switzerland (German) */ problem!)
#define TR 9 /* Turkey */
#define SU 10 /* Finland */
#define N 11 /* Norway */
#define DN 12 /* Denmark */
#define ??? 13 /* Saudi Arabia */ (I don't know that one)
#define NL 14 /* Holland */

Maybe some common prefix should be added to all these names, to avoid
clashes with other uses of one- and two-letter abbreviations.

Because my port of bash (which is what is being described here) uses the MiNT libs (and hence only works under MiNT), which don't understand more than the r and b options of UNIXMODE.

ps. I think I will post a new bash 1.10 binary, since I've just gained FTP access and it's real easy for me to do this. Should be on a.a next week.

The MiNT-version of bash 1.10 is compiled with the mintlibs
patchlevel 14. They do not support UNIXMODE, because these things
should be done by the kernel. But maybe the kernel (stat) could do
what UNIXMODE does when the `x'-flag is set: to look at the first two
bytes of a file in order to find out whether it is executable or not?
But for the system()-call and for the TOS-part of stat() I think the
$SUFFIX-Variable might be a good solution. (Many ACC can be startet as
`normal' programs and so one had just to call system("foo") to start
"foo.acc" if $SUFFIX contains `ACC'.) And I would like it if Bash
had $SUFFIX, too.

Please check out if there is any possibility to do this job with
VDI-calls. The linea-calls will disappear in future TOS-Versions and
therefor they should not be used any longer. Else, your program will
crash on newer versions of TOS.

555. Sample -> Sound chip

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-05 14:50:32 UTC
From: herborth@riipsdev.Waterloo.NCR.Com
Message-ID: <8983@ncrwat.Waterloo.NCR.COM>
Source record: 45699

Would someone care to tell me (or point me to a text file somewhere) how to take a normal 8-bit sample, and dump it into the sound chip so that it plays?

I want to make a routine to use as a USER_DEF object in a GEM dialog box or whatever, that plays a sample instead of drawing something onscreen.

(I recall Dave Baggett posting a good article about a year ago on how to do this, but I forgot to save it...)

From: herborth@riipsdev.Waterloo.NCR.Com
Message-ID: <8984@ncrwat.Waterloo.NCR.COM>
Source record: 45698

Last night I tried Eric's suggestion on how to fix the tcsh/MGR problem (ie, not being able to run tcsh while in mgr) by creating a symbolic link between u:\pipe and u:\dev for the ttys that tcsh was trying to create.

The tcsh ttys are in the form ttyp.pX where X is a number...

Unfortunately, after creating the symbolic links, I was completely unable to open a window in MGR, which told me "Unable to create pty".

Now, I'm the first to admit that I don't really understand how symbolic links work in MiNT (or Unix for that matter), but I did try it, and I hacked around a bit trying other things (like creating the sym link backwards) that didn't work... Any other suggestions (other than not to use tcsh... I figured that one out!)?

>the TOS version. There is a patch program in the public domain that fixes
>this.

If you are MWC user and in a need of a low-level debugger then your best
bet is to forget entirely about DB.PRG; OS version regardless.
It appears to play nasty games with your machine and no amount of
patching will help. Try instead szadb, version 2.1, which was posted
recently in comp.sys.atari.[sources, binaries]. This in NOT the one
which comes with an official version of Sozobon C. If you do not have
TT with a big monitor you may try version 1.4 instead available on
atari.archive.

Version 2.1 supports the following symbol table formats:
DRI (Alcyon, Sozobon, gcc), MWC, GST (gcc -G), SozobonX
and so far it was doing that transparently to the user.

What about exchanging the monitor at your Atari dealer, since you're
not satisfied with the monitor (due to its focussing problems), until
you get one, which doesn't have these! (Here in Germany you can do
such things, if this is not so in other countries; don't flame me for
this posting, since I cannot know all laws of all countries... ;-)

yours,
Benedikt

Actually I would say, get yourself a copy of Lattice C, since MWC isn't
supported anymore (as far as I heard)!?!
I have both, they are both quite good, even I must state that Lattice C
is better with regard to many items (code size/speed, capabilities of
the compiler, and so on...)!

...but can someone tell me, where I can get the MWC csd?

The Mega STe doesn't have a SCSI port but does have a place for an internal DMA to SCSI adapter. If you bought a Mega STe with internal hard drive you got an Atari adapter with it. Without looking at the schematic, I can't say for sure that it won't support multiple hard drives. However, there is a DIP switch on it (the one I saw) that allows you to map SCSI device 0 to any DMA device - every adapter I've seen with a switch supports only one drive.

I think that the MiNT kernel tries to avoid this problem by sleeping and
retrying a memory allocation when it fails. I.E., If allocation of a process
region fails, it assumes that the failure might be temporary, sleeps a bit,
then tries again. (However, it looks like only one retry is attempted.)

There's an ISO standard of two-letter abbreviations for country codes, and another for languages. Might be a good idea to follow it (and if anyone can find it, please post the info: I've been looking for it for a while via other newsgroups, but nobody has replied to me yet).

565. Need to trap drive select function

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-05 19:58:04 UTC
From: bwhite@oucsace.cs.OHIOU.EDU
Message-ID: <4872@oucsace.cs.OHIOU.EDU>
Source record: 45720

In the continuing interest of expanding my 1040ST's capabilities, I've decided to try and get it to work with four drives. The way I've got it into my brain to do this is to steal control of the function that sets the drive select lines (DS0 and DS1), and setting them both high in order to select the second bank of two drives. Since this is probably about as clear as mud, ...

DS0 DS1
L L Select lower bank
H L Select drive 0 (lower bank) or drive 2 (upper bank)
L H Select drive 1 (upper bank) or drive 3 (lower bank)
H H Select upper bank.

The advantage of this is, as far as I know, nothing ever sets both DS0 and DS1, so backwards compatibility should be no problem.

So I need to know from any of you kind souls, how exactly does GEMDOS go about deciding what to do when something asks it for a drive? Do I need to write a device driver? and if so, just where do I get the information on how to do this? Or is there an easier way?

Email response is preferred. If/when I get this contraption and software working, I'll post instructions should anyone want to do the same.

Thank you for your time.

>who knows if this can be done and how this can be done?
>

Just try to do an Fseek on the handle, if it's a tty you will get an error, if it is a file, the call will work (or get end-of-file). Look at the source for isatty in a PD-C library (for example dLibs) for the details.

>I want to use this type of stuff in writing a function that does
>all things you may want for calling an external program, e.g. path
>search, redirection, wildcard substitution, environment
>substitution, pipe simulation etc.

The Shareware shell MASTER V6.0 has those features:

- You can call external programs (GEM or TOS).
- You can set up a PATH for searching files.
- You can redirect the input:
* from a file: cmd < file
* from the standard-input: cmd << text
* from a shell-variable: cmd <- var
- You can redirect the output:
* into a new file: cmd > file
* append to an existing file: cmd >> file
* feed it into a variable:
+ stopping when the variable is full: cmd --> var
+ ignore the rest when the var is full: cmd ==> var
+ omitting multiple spaces: cmd -> var or cmd => var
- You can redirect the stderr output (just use 2>, 2>>).
- You can redirect both stdout and stderr (cmd > file 2>&1 or cmd 2> file >&2).
- You get wildcard substitution: ls *[^o] (files not ending with o).
- You get environment substitution (just say $var).
- You get pipe-simulation (using unvisible shell-vars or files - as you like).

568. Cheap PMMU deficiency solution for STs?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-05 20:13:31 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <1992Feb5.151332.8916@miavx1.acs.muohio.edu>
Source record: 45911

Well, sitting in my operating systems class today, I started thinking about multitasking on the ST, and the advantages a PMMU would have for it. The 68000 doesn't have any support for a PMMU but a 68010 does? I remember people trying to use a 68010 in their ST, and it didn't work, but this was before TOS 1.62. What would it take to get a 68010 and PMMU running in a ST.

"Why don't I just wait for a 68030 upgrade board to come out?" you ask. Well, I CAN'T AFFORD ONE! The SST is supposed to be $700 without a 68030, and the Fast Turbo/030 (or whatever its called) is around $1200!!! (I could be a 386sx system for this much.

I want to stay with my ST, and I want to take advantage of software that requires a PMMU. (I wonder if ASV would run on a 68010/PMMU ST?)

Thoughts?

Later.......

From: simon@elvis.csd.uwm.edu
Message-ID: <1992Feb6.000652.14201@uwm.edu>
Source record: 45711

I have been having a problem with my ICD hard disk software. When I boot up and change from low resolution to medium, or vice-versa, my ST will not run any programs from then on. It allows me to double click the program name and then it clears the screen, but gets no further and just hangs up.

I have tried removing all my DAs and auto programs but nothing seems to stop this.

Also, I get the same problem whenever I softboot my ST. I have to always do a cold boot, just to be able to run anything... surely this is wrong.

Does the ICDBOOT.SYS stuff try to pull some system vectors that get screwed up when I change resolution or do a soft boot?

I am running on a MegaST2 with 'rainbow' TOS and a Quantum 100Mb SCSI drive.

Has anyone else had this problem or know how to fix it?

I heard that Claus Braud (Sorry if I spelt this wrong) wrote his own hard disk drivers; where can I get a copy of them? Are they PD?

Thanks in advance.

Hello, ST netters

My Atari's SC1224 Color monitor switch went out on me recently. Its contacts don't make good connections. I opened up the monitor, and found that it connects via two red wires to a pc board on the bottom through a little insulated plug.

Does anybody know where to get one of these things? I really need one bad. I had to bypass the switch (I just shorted the two together) to use the monitor! Please help me!!!!

Email me

But they now have PC/Mac and Amiga version, but from what I can see
the Atari market is dead, so why try to sell to a dead market..??

Here in NZ, we have about lost any support for Atari, the importer has
almosts gone bust, dealers get no more credit.

One big dealer is having a Atari clear out sale here.

Also you can bye a TT here, but no monitor for it, but the TT sells here
for more than a 486 with monitor..

From: meulenbr@ce.philips.nl
Message-ID: <1992Feb6.110531.14391@philce.ce.philips.nl>
Source record: 45719

Does anyone know if it is possible to transfer data to/from the acsi port
of the ST/TT without doing dma. I would for instance like to issue a
request sense command without having to reissue the command 4 times due
to the buffering in the dma chip. Therefore I'd like to circumvent the
dma completely for such short commands.
Does anyone have any idea if this is possible?
I haven't seen any statements that it isn't in the literature, but also
I haven't seen code which does things like request sense without dma.

>Out of curiousity: How are you guys measuring the amount of free memory
>on your system? Are you sure that you are not just measuring the size
>of the biggest free block in the system? That may fluctuate depending on
>the current memory fragmentation...

First of all, I'm sorry. I should have mentioned how I measured free memory. However, I don't think it's fragmentation. I used the `memap' program which also tells me about the fragmentation. Before starting the big pipe, it showed 3.5 MB free in one big chunk and one small block of about 12 KB. After the pipe, the number of fragments was the same, only the big chunk was smaller. The small chunk stayed the same.

I have not been following my own thread for a week (dumb shit that I am) so I cannot say who responded to my problem, or who said what. I'll try to catch up on the news. Next time I'll post a precise output of what I actually gave tcsh to execute, plus an exact recording of memap's results.

The more I use MiNT, the more I like it. Unfortunately, I cannot look into the sources right now, because I'm busy working on my Master's thesis. After that is done, however, I'll try to contribute.

One thing I have noticed is that MGR gives this message for other things, like
an invalid (or unset) SHELL environment variable. Try setting SHELL to a shell
(or any program you like) you know exists and works and then run MGR.

I think the line A calls will stay in place for the ST's resolutions, even in future TOS versions. I'm not advocating their use, but if a program is tied to, say, lo rez anyway, there's no real advantage in using VDI (especially since the VDI does _not_ support the line A sprite calls).

Don't return -1 -- GEMDOS returns this for programs that crashed.
Positive return values are more common for such problems.

I don't think it is (I'm sure I'll be corrected if I'm wrong!).

As far as I understand it, there is a 16-byte FIFO buffer on the DMA chip, and data goes from there out to the register that is latched onto the port lines. I don't think you can directly access that register.

I couldn't get email through to you but I thought you'd see the recent
post I made on the subject. In any case, check out
atari/sound/players/resound.arc on atari.archive for assembly language
source to play samples through the sound chip. Note that it assumes
unsigned 8-bit samples, which is what the sounds on atari.archive are.

Dave Baggett

Well gee, since there's such demand, I'll post what I've got saved. This is from email; I may have posted it a while back -- I don't really recall.

Dave

To: aimd%castle.edinburgh.ac.uk@relay.cs.net
Subject: sample playing

>I've got this source code for playing a sample but I don't understand
>the interrupt routine that plays the sample. This is for RESOUND btw, it
>might even be yours, I'm sorry, I don't know who it's by.

Resound is by David Snow. I've been giving that source out because I can't give my own source out (it's for a commercial product).

>Could you possibly tell me why dc.w is used rather than the instructions
>explicitly and what exactly those movep instructions will be loading
>into the sound chip (I thought only FF8800/02 were valid? But doesn't
>movep.l address further than that - or am I confusing movep's operation?)

Your are correct. I'm not sure why the movep.l works in this case but it does. I think that Atari may have printed something on the matter years back. [Actually, it's in the developer's docs, so I'd say this counts as a "documented practice." -Dave, 6-Feb-92]

In any case, movep writes successive even address bytes, starting with the destination address you specify. E.g.,

movep.l D0, FF8800

writes the following:

MSByte -> FF8800
Next-to-MSByte -> FF8802
Next-to-LSByte -> FF8804
LSByte -> FF8806

The writes to FF8804 and FF8806 get routed to FF8800 and FF8802 for some reason which is completely beyond me. If you don't trust this to work you can always use two movep.w instructions, but you won't be able to play back at 22kHz if you do since it'll be slower. All the

digitized sound players I've seen use movep.l.

Snow uses dc.w I think because his assembler doesn't understand
movep for some reason.

>Also, I don't understand what all the values in the internal sound
>lookup table do! Presumably they control the sound chip but I don't know
>what they represent.

If I recall correctly, the sound chip registers work this way:

Memory location Size Function

0xFF8800 1 byte Selects sound chip register to access
0xFF8802 1 byte Data to read/write from/to selected reg.

For example, to write to register 3 on the sound chip, you would first
put 3 (byte-sized) in the location 0xFF8800, then put the value to
write to register 3 in location 0xFF8802.

The reason the interrupt routine uses movep is because the table
contains 6-byte entires (well, 8-byte entries if you coun't the 0's in
there for "padding"). This is because there are three channels on the
sound chip, and for each channel there's a byte for 0xFF8800 and a byte
for 0xFF8802. Playing noise at different volumes on various
combinations of the channels provides the 256 discrete amplitude
values need to play 8-bit digital audio. Note that you want all
tone (frequency) generators OFF when you play a sample. You _only_
want the noise generators on.

Here's the basic sequence of events in the interrupt routine:

1) Get the next 8-bit sample. (Move pointer ahead in sample data).

2) Convert 8-bit sample value to table offset. The table contains 8-byte
entries, so multiply the sample value by 8 to locate the first
byte of the 6-byte "packet" to write to the sound chip. The two
bytes after each 6-byte packet are for padding. Otherwise, you'd
have to multiply by 6 instead of 8. (Much slower; a multiply by
8 can be implemented with a simple bit shift whereas a multiply by
6 requires a MULU instruction).

Set channel A volume:
3) Write the first byte of the 6-byte packet to location FF8800
Write the second byte of the 6-byte packet to location FF8802

Set channel B volume:
4) Write the third byte of the 6-byte packet to location FF8800
Write the fourth byte of the 6-byte packet to location FF8802

Set channel C volume:
5) Write the fifth byte of the 6-byte packet to location FF8800
Write the sixth byte of the 6-byte packet to location FF8802

6) Return from interrupt (RTE)

>Finally, the frequency stuff, I think there are two bytes, one data, one
>control for the MFP timer A to get the sample rates correct. How do
>these work out accurately? eg. the first tuple is $0506? (5 1/2 KHZ I guess)

The basic frequency of the MFP chip is 2.4MHz (or something like that).
One of the MFP registers is the "prescale"; this is what the clock
frequency gets divided by. I think a value of 1 means prescale of 4,
yielding a frequency of 2.4MHz/4 = 600kHz. So if you set prescale to
1 you should get an interrupt that occurs 600 times a second. (Too fast
for the ST to handle, I imagine.) There are other prescale values;
I think 2 means divide by 10, 3 means divide by 16, etc. You'll have
to check the actual values since I don't remember them offhand.

In addition to the prescale register, there is a "count" register, which
is just a further divisor. If you set prescale to 1 (divide by 4) and
count to 255, you get (2.4MHz / 4) / 255 = 2352 Hz, or an interrupt
that occurs 2,352 times a second. Whereas the prescale register contains
a value that _corresponds_ to a particular divisor (e.g., 1->4, 2->10, etc.),
the value you put in the count register is _itself_ used as a divisor.
(e.g., if you put 12 in the count register, the clock will be divided by
12; if you put 5 in, the clock will be divided by 5, etc. A value of
0 means divide by 256 if I remember correctly.)

It's pretty simple to tweak these two registers to get any frequency
you want (or a frequency close enough for sample-playing purposes).

Note that you want to use Timer A. Don't use any of the other timers
unless you want to nuke your OS [or your RS-232 timing, in the case
of Timer D. -Dave, 6-Feb-92].

Hope this helps,

Dave

589. AJAX-chip info wanted

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-06 23:43:50 UTC
From: m91der@tdb.uu.se
Message-ID: <1992Feb6.234350.8527@tdb.uu.se>
Source record: 45732

I just bought an AJAX-chip for my Mega STE and I now need
some information on it.

What does AJAX stand for?

How fast can it run (8 MHz for DD, 16 MHz for HD, 32 MHz for
2.88 meg drives?)?

Is the Mega STE prepared for 2.88 meg drives (can it support
the high clock-freq to the AJAX-chip that is required?)?

Has it more functions than the WD1772?
If so, where can I get hold of the information?
Is the info only for developers?

Can it read Amiga-formatted disks if programmed properly?
(the WD1772 couldn't because of hardware bugs, or?)

>sells good for the ST, too...
A few months ago there were some interviews with different ST software
developers. A clerk of GFA stated that his company does no longer see
a market for Atari ST products. In the last few weeks GFA Duesseldorf has
been closed. Only two of them (including Frank Ostrowski) are at GFA any
more (now at GFA in Luebeck - yet another German city). They will only
continue developing GFABasic for Unix, MS-Windows and MS-DOS, as far as
I heard.

yours,
Benedikt

>get this one to work first....

Connect it to an ICD-Advantage (best ST-SCSI host adapter). Then
go out and get at least TOS 1.04 or TOS 2.06 for your normal ST,
since then you'll be able to have BGM-Partitions of up to 256MB
per partition - - - OR you might as well split it into partitions
of TOS 1.00 max-size (Sorry, I don't know the max-size of a TOS1.00
partition) and switch of several of these (switching them on only if
you really need them (you have to change your setup and reboot your
ST for this purpose...). :-(

I see no other way for this...

Benedikt

>say, lo rez anyway, there's no real advantage in using VDI (especially since
>the VDI does _not_ support the line A sprite calls).

Line-a is also partially supported on the TT-low and TT-med resolutions. It works as long as you recognise these restrictions:-

1) Not the whole width of the screen is supported, only the leftmost 256 pixels in TT-low and 512 pixels in TT Med.

2) You can only use a maximum of 16 colours on the screen at any one time (You can't use the whole 256 in TT-low).

The advantages are:-

1) Line-a runs about 10 times faster than VDI on the TT! (I've timed it!)

Well.. that's about it really.. VDI is a real dog.

A plea to Atari.. If VDI is the only thing you will support in the future OPTIMISE IT! As it is currently an IBM clone (386sx, VGA) has a better graphics performance than a TT using line-a.

And another thing.. why not make the GEM window borders 3d, not like Windows, but like Motif, and make the icons multi-coloured.

These are two things which stop the ST/TT from getting the "Wow!" effect. The "Wow!" effect sells computers. It doesn't matter if it can't compute 2+2, as long as it looks great in the stores.

598. CS-TeX

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-07 09:59:15 UTC
From: oli@math.rwth-aachen.de
Message-ID: <oli.697456755@ernie>
Source record: 45895

Is CS-TeX the famous Strunk-TeX? If so, where can I ftp it? Does it coexist
with Lindner-TeX, at least regarding font directories for the dvi drivers?
I would like to give it a try since someone mentioned it to be Mint-aware.

Oliver

599. STDCAT 5.0b fails on disk volume renaming: ROOT DIR Destroyed

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-07 10:47:47 UTC
From: ralph@laas.fr
Message-ID: <RALPH.92Feb7114747@orion.laas.fr>
Source record: 45896
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I ran STDCAT50 under GULAM on a Mega 4 ST with TOS 1.2 and
with PINHEAD21 installed. I was surprised at the following behavior
since STDCAT 4.3 worked *so* well. It might be my configuration. It
might be STDCAT.

The night before last I decided to catalog some new unlabelled
disks. In order to control the order of the new disks I turned off
the disk sort field. That way, when I added a box of disks they would
be stacked at the front of the disk list, last disk added being first!
(This is a slight inconvenience.) I was using the MULTI option of
ADD.

I then went through the DISK NAME menu, also with the MULTI
option. I would go through the same box except this time in backwards
order. I specified Update Volume on Disk! Everything went fine in
the database. But last night, when I looked at some of the disks
there were two problems:

1) When I specified a disk name of SOZOBON.001 I would find on
the disk (with VOL.TTP) only SOZOBON.

2) Furthermore, the root directory of *ALL* the disks except the
first one were COMPLETELY DESTROYED! ALL THE DISKS HAD THE SAME
ROOT DIRECTORY AS THE FIRST DISK! I am at a loss as how to recover
the files, as only the directory has been wiped. The problem would
also happen when I renamed existing disks!

Also, any suggestions for recovering the files? Any tools for
rebuilding the root directory?

From: elendir@inf.enst.fr
Message-ID: <895@clbull.frcl.bull.fr>
Source record: 45907

Hi !

A friend of mine is writing a small desk accessory. He wants to be able to execute GEM or TOS programs directly form it (i.e. It displays a file selector, and then launches the program you selected). But so far, he seems to encounter some difficulties (One of them being the fact that Pexec calls Malloc to reserve memory, and Malloc is prohibited when used within a desk accessory).

Have someone any hints or tips to solve this ?

I know a program, called ICONS 3.7 which does it fine; so it must be possible after all.

Thanks,

Vincent.

PS : Please, answer by Email (Elendir@inf.enst.fr). I got news a week late. E.g: we are February 7th, and the last news I got was dated January,29. Oh well...

601. Pure-C cdecl woe

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-07 12:24:46 UTC
From: ib09@rz70.rz.uni-karlsruhe.de
Message-ID: <1992Feb7.122446.21293@rz.uni-karlsruhe.de>
Source record: 45593

Just found out a bug in Pure-C (or else they removed a feature from
Turbo-C, but I don't really believe that):

Pure-C no longer seems to support pointer to cdecl - functions
(those that pass all their parameters via the stack). The following
gives a syntax error:

```
int system(char *cmd)
{
int cdecl (*doit)(char *);
/* rest deleted, I think you can guess what it was */
}
```

I recoded my system() routine in assembler, so no real harm was done,
but it's annoying just the same. Grrrr....

Well you could just bye a Happy, that has a option for 2 more drives, giving you 4 disk drives total..

>supported anymore (as far as I heard)!?!
>I have both, they are both quite good, even I must state that Lattice C
>is better with regard to many items (code size/speed, capabilities of
>the compiler, and so on...)!

The other side of the coin: I've used both MWC and Lattice C
extensively recently, and I'd say overall that I prefer MWC. Lattice C
has a few more options but the command syntax is utterly brain-damaged
and there are quite a few annoying quirks like incorrect handling of
include directives. Their librarian is also excruciatingly slow
(though not as slow as Laser C's). Lattice C also won't link DRI
format object files, so if you've got any MadMac source code you won't
be able to use it with Lattice.

If you're used to Unix and will be using a command shell like Gulam,
MWC is a better choice, at least in terms of software quality. At
least you won't have to type, e.g.,

lc -L+libgfoo.lib+libbar.lib simple.c

to link with other libraries under MWC!

Obviously you're not going to get a whole lot of support out of Mark
Williams for the ST product these day, though.

(All of the above IMHO.)

607. Can this be done? (Hard Drive creation)

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-07 16:44:37 UTC
From: dddean@bluemoon.rn.com
Message-ID: <3o0RFB1w164w@bluemoon.rn.com>
Source record: 45908

I happened to have a dead external SS Drive, (bummer) and I thought that I would take it apart to see if I could fix it. I noticed that basically the drive is an IBM compat with that little converter attached to the pin connections. I began to think about Hard Drives, and was wondering if there was any way that I might be able to just take an IDE Hard Drive, (Maxtor 120mb for example) and exchange it for the drive, and then just having my 'B' drive now be a hard drive. Would this work? Would I be able o actually format the Hard Drive to a full 120mb and use it?
OR..Would the drive act up, because my Atari will want to format it either Double Sided or Single Sided?

If anyone can help me out, I'd appreciate it.

Thanks.

ONM07@DMSWWU1A.BITNET writes:

>This was easy. Just use archie to look for '3166':

>From: Codes for the representation of names of countries.
> Third edition; ISO 3166: 1988 Aug 15; 53 p.

>Afghanistan AF AFG 004
>Albania AL ALB 008
>Algeria DZ DZA 012

etc. Thanks for this list; it's only missing a few of the more recent
countries (say. Latvia/Lithuania/Estonia), which I know codes exist for.
I think I've got those saved off somewhere; next question is how
to find them!!!

Getting further off the original thread....the X/Open Portability Guide
(XPG3) mandates locale name strings using the following format:

<locale name> ::= <language>_<territory>.<encoding>
<language> ::= based on ISO 639
<territory> ::= based on ISO 3166 (country code)
<encoding> ::= "EUC", "SJIS", ...

Now....we've just taken care of ISO 3166, what about ISO 639?
I used archie to look for 639, but it didn't turn up anything horribly
obvious (there are too many matches to go look at all of them,
and most seem like they're probably usenet article numbers, anyway).

>Is CS-TeX the famous Strunk-TeX? If so, where can I ftp it?

Yes. You can get it from ftp.thp.uni-koeln.de (within Germany) and also
atari.archive.umich.edu (rest of the world). It's also in Stuttgart somewhere
but I forgot if it is the same version as that in Cologne. There will be a
new version soon but it's not decided yet when. I hope that CS will wait
for DEK to release 3.141.

> Does it coexist
>with Lindner-TeX, at least regarding font directories for the dvi drivers?

Yes, you have to set a variable somewhere. It's all in the docs, but you can
also look at the help screen of the various dvi processors.

I personally don't like the Lindner-TeX font dir layout, but I agree that it's
much nicer to just set a variable than having to shuffle font dirs around.

>I would like to give it a try since someone mentioned it to be Mint-aware.

Please let us know what you find out and what you like/dislike about CS-TeX.

From: marshall@cs.uq.oz.au
Message-ID: <6551@uqcspe.cs.uq.oz.au>
Source record: 45905

I discovered why my MegaSte kept giving "out of memory" messages when I booted up or ran a program. I wanted to set up NEWDESK.INF so that I could run *.arc, *.zoo, and *.lzh files as applications to the same arc'ing shell. So I set up an application for *.zoo, copied the "G" line twice, altered one line from *.zoo to *.arc, and the other to *.lzh.
The effect was the message, as above, and also: a phoney printer icon was installed on the desktop, with a non-alphanumeric identifier!
When I removed the offending lines, restoring NEWDESK.INF to its original state, everything was OK.
Thanks to everyone who replied with suggestions.

GP> Organization: Lexington Public Access Unix

GP> Hi guys,
GP> I have a Question for you.....
GP> How would you go about partioning a 1.6 gig SCCI drive on a
GP> 1040STf with Tos 1.0? I know go get a new STE, but I need to
GP> get this one to work first....

GP> Greg
Get the Atari drive utilities 5.0.
At this time that would be the only way to do it...
Tos 1.2 and older have a limitation of 16 meg per partition and a limit of 16 partitions.
That would only be 256meg...
Even using tos 1.4 or newer would only allow you to use a little more..
16 partitions of 32meg or roughly 512meg..

WHat host adapter are you using? The Atari Hard Drive utilities SHOULD work with it..
If it don't, then you need to get a different host adapter.
If you want a major portion of it setup as a non standard drive you can get by without
using the atari hard drive utilites.

> Fclose(foo);
> Fclose(bar);
>you're closing the same file handle twice.

And in the example i gave, TOS is doing this closing.
As far as i have seen (in a published source for TOS 1.02), the bug is that they use a two-level system to access files. The first level is an array (to which the handle is an index) with entries having a pointer to the second level structure - the so called file control block (FCB) - and a count for the number of users of this FCB.
When Fforce(stdhandle, nonstdhandle) is called, the user count for nonstdhandle is raised by one. If a file is closed, the count is decremented and when it becomes zero, the FCB is released to the OS memory pool.
When Fdup(stdhandle) is called, where stdhandle is an alias to some handle x, you get a new handle with user count 1 and a pointer to the old FCB. This is wrong since the FCB would be free'd whenever the new handle is closed. And from this moment on, all other handles refering to this FCB (for example, but not only the old nonstdhandle) have a pointer to unallocated memory. If this memory is reused sometime, you will get very strange effects.

615. GDB -- why is it such a memory hog?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-08 04:41:43 UTC
From: adrian@splunge.uucp
Message-ID: <1992Feb8.044143.16685@splunge.uucp>
Source record: 45610

```
The TOS binary for a particular program of ours is ~170kB when
compiled with -O under gcc-1.40. When compiled with -g instead,
the binary is about 540kB and the symbol file produced by sym-ld
is about 700kB. Given that the total size is ~1.25MB, why does GDB
report "virtual memory exhausted" on my 2.5MB ST when it tries to
load the symbol file? I've stripped the machine to its bare
minimum; I've even tried ditching the shell and running it from the
Desktop. No go. Is there any way around this, short of buying
more RAM?

> [lots and lots of informative musings on playing samples]
> have to multiply by 6 instead of 8. (Much slower; a multiply by
> 8 can be implemented with a simple bit shift whereas a multiply by
> 6 requires a MULU instruction).

Actually the best way to do a multiple by 6 in assembly language is
as below. e.g. d0=d0*6

```
move d0,d1 d1 = d0 * 1
add d0,d0 d0 = d0 * 2
add d1,d0 d0 = d0 * 2 + d0 * 1 == d0 * 3
add d0,d0 d0 = d0 * 6
```

This much quicker than a MULU. Fixed multiplies should always be performed
this way if the code is speed critical.

617. How to get an Internet node on an ST/TT

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-08 16:48:35 UTC
From: r0mill01@ulkyvx.louisville.edu
Message-ID: <1992Feb8.164835.21783@vlsi.louisville.edu>
Source record: 45916

I hope this tech forum is the proper place for this question.

I want/need to establish my own network node. I have picked up MECURY for usenet (uucp) access. The docs mention Internet but I know that that network is not the same as usenet (as the docs seem to imply). My question is how does one create a news-accepting, mail-forwarding Internet node as a private individual or non-profit organization AND can the ST or TT support that kind of thing. I assume I'd need a high-speed connection (probably a leased-line) to an existing site. But what other hardware/software would I need, and who else should I contact to establish such a license?

BTW I moderate a digest for English teachers via a guest account that's costing over $100.00 per month. I want to increase the number of NEWS sources I glean for information/inclusion but can't afford to increase the time I'm on each month.

Any help/advice would be greatly appreciated.

According to "Het complete Atari ST boek" (the Dutch translation of
"Das Atari ST Profibuch") this is not possible. The FIFO that is part of
the DMA controller is the culprit. This FIFO will not output anything
until 16 bytes are received. Period.

I don't think that the performance of the ST computer is significantly
affected by this design decision. It is however complicating the software
needed to operate the machine. After reading abount the art of programming
floppy disk controllers in the PC (in the MINIX book), I am not seriously
discouraged by the Atari DMA problem...

619. Sticking in a 68010

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-09 00:38:57 UTC
From: cstdxas@warwick.ac.uk
Message-ID: <mcwdbbdw@csv.warwick.ac.uk>
Source record: 45921

I am thinking of replacing my 68000 in my TOS V1.02 ST with an 68010 for a bit of fun. I have written a bit of code which I think will get around the "MOVE from SR" incompatability by trapping the "Supervisor instruction in user mode" (I forget its name) exception, re-executing the instruction and continuing. I can't see any other incompatabilities - have I missed anything?
I think I can get the code into the memory before TOS uses that instruction, but I it may have to be autobooted in (Which will be a pain with my hard disk since it already has code to load the driver in the boot sector).
By writing custom RAMDisks and Caches (to take advantage of the loop mode) I think I will be able to get a 20% speed increase when doing something disk intensive like compiling.
Has anybody replacing their 68000 with a 68010 or above (whether successfully or otherwise)?

>
>
>Dave Baggett
>dmb@wam.umd.edu

Also, Lattice C Ver 5.06.02 (LC5) hasn't been updated since Dec 1990,
which is over 13 months ago. And LC5 has many other
bugs including not locating data files (such as .RSC files) when the
executable program is run within the LC5 editor.

Also LC5 does not have a source code debugger. And the compiler options
are very confusing.

All in all, I find LC5 a real pain to use. I have stopped development of
several C programs due to the frustration of using LC5.

And the sad thing is LC5 is the BEST of the still supported C compilers
for the ST. Laser C hasn''t been updated in years. MWC is dead.
Turbo C is German Only. I bought Turbo C and it was horrible to user
given the non-English manuals and all. And Turbo C isn't MAKE/UNIX
based either.

So, actually that just leaves the GNU C/C++ compilers.

The ST/TT compiler market really sucks!!!

Adam,
Simply get a NULL modem cable. Connect the two ends (one on the Atari one
on the Amiga.. careful an IBM may result) and run the apropriate comms
package on each end and you are all go. If you are going to do a bulk file
transfer may I suggest you use Z*MODEM for this purpose on the ST try using
XYZ2.ttp .

Ok, here's what I have heard on the subject. (no responsibility accepted for wrong info)

You cannot replace the 68000 with a 68010 without patching the ROMs as TOS V1.2
or less use MOVE SR, <ea> in the boot-up code. I have heard of patched ROMS, but
this is not worth the hassle as TOS 1.4 and greater are supposed to work with
any of the 680XX processors.

Frans,

I don't see how this is possible. All lines to the ACSI port (except HDINT)
go through the DMA chip... So like it or not, you still have to go through
it.

Hi Steve,

I've been working on an (extended!) Motif-like "windowing system"
for the ST. I had rewrote the MIDI, mouse, and keyboard processing
that WAS in the OS (for developing real-time MIDI software), and
thus I couldn't use VDI. I dove into using LINEA, as I needed to
draw a mouse pointer, and allow full interaction.

I'm hoping that a little demo I'll be posting shortly will run on
the TT, and I'd look forward to your trying it, if you
don't mind. I have a 1040STf with TOS 1.0, and it works OK on
my system. I've never even seen a TT in real life, nor any TOS
versions other than 1.0!

I implemented 3D shadowing, and simulated 3D moving of selectable
items, images, etc. Currently I only support medium resolution.

John

632. Memory protection again...

Newsgroup: comp.sys.atari.st.tech

Well, I didn't get any responses to my query for details about ST/TT
memory protection, so I'll ask yes/no questions :-) :
Is there any memory protection in the TT other than that which is in the
ST (only supervisor mode code can access system variable and hardware
registers)?
Will there be any in the future (educated guesses also)?

Thanks,
Steven Ourada

----
[26]
>
>since shifts are faster than adds? (Just to be incredibly pedantic) :)

Ultra-predantic: You can see from the timings I've added above that
your method is actually slower in this case. add's are faster than
lsl's until you get to a shift of more than two bits:

(1) lsl.w #1, d0 [6 + 2n = 8]
(2) lsl.w #2, d0 [6 + 2n = 10]
(3) lsl.w #3, d0 [6 + 2n = 12]

vs.

(1) add.w d0, d0 [4]

(2) add.w d0, d0
add.w d0, d0 [2 * 4 = 8]

(3) add.w d0, d0
add.w d0, d0
add.w d0, d0 [3 * 4 = 12]

Here you can that the break-even point is a bit-shift of three places.
Beyond that lsl is faster, but before that add wins.

(See what you people get for criticizing my post?) :-) x 10

cstdxas@warwick.ac.uk (Leo Hendry) writes:
:
: I am thinking of replacing my 68000 in my TOS V1.02 ST with an 68010 for a
: bit of fun. I have written a bit of code which I think will get around the
: "MOVE from SR" incompatability by trapping the "Supervisor instruction in
: user mode" (I forget its name) exception, re-executing the instruction and
: continuing. I can't see any other incompatabilities - have I missed anything?
: I think I can get the code into the memory before TOS uses that instruction,
: but I it may have to be autobooted in (Which will be a pain with my hard disk
: since it already has code to load the driver in the boot sector).

You have two problems (as far as I know):

1. The stack-format is different between the 68000 and 68010. This
means TOS-versions prior to 1.6 (or is it 1.4?) won't work
correctly.

2. As someone else mentions in another followup to your article the
SR-move instruction is used BEFORE the computer loads (and
executes) the boot-sector of your boot-drive. I'm not sure if he's
right about this, but since loading requires some interrupts beeing
enabled/disabled it's VERY possible he is right.

Conclusion: GET TOS 2.06 (or 2.07 when they release it)!

BTW, if you decide to change processor (and put in a new TOS) then
you could increase the clockspeed to 16 MHz at the same time. The
only things needed are some 74LS00 and some other INEXPENSIVE chips.
This will not give you the same performerance as a Mega STE since
the MSTE has a cache (and building your own cache isn't very easy).
There must be thousands of 'blue-prints' for cache-less turbo-boards
floating around. They all work the same: Putting the processor in
8 MHz as soon as it deals with the bus and run it at 16 MHz when
'internal' calculations are performed (MUL and DIV for example will
be twice as fast (almost)).

There are only two problems: Finding a 16 MHz 68010 and removing and
putting a socet in WITHOUT destroying the motherboard.

Good luck! Share and enjoy!

I have a 4 meg 1040ste with a socketed 68000. Is there a simple
way for me to put in a faster processor and get a significant
speed increase? How much would that cost me? Has anybody done it

yet? I am running tos 1.6, but you knew that already...right?

There *is* of course the ISO standard, which assigns a 2-character code
to each country, and a 3-character code for the national currency.

DE DEM Germany
NL NLG The Netherlands (please don't use Holland: it is on a *small*
part of my country :-))
US USD United States of America

etc, etc, etc..

Hope this says it all.

I bought NVDI 2.0 from Bela, it is a full replacement for the Atari VDI.
It is 3-10 times as fast, and also fixes several VDI bugs. I have used it
for 2 months now, and I am very satisfied with it.

>Does the ICDBOOT.SYS stuff try to pull some system vectors that get screwed up
>when I change resolution or do a soft boot?

I don't know the current ICD stuff, but well, what you've run might
indicate that.

>I heard that Claus Braud (Sorry if I spelt this wrong) wrote his own hard
>disk drivers; where can I get a copy of them? Are they PD?

(corrected spelling beneath 8-) Yes, I did write a hard disk driver of
my own called CBHD. It's part of hard disk book we published some time
ago, so, unfortunately, it is not PD in any way. While I'm sure that
my driver would solve most of your (hard-disk related 8-) problems,
you should first check out if ICD has something to say on their
software and why it seems to crash on your computer. Maybe it is
just a configuration problem of some kind.

If you're still having trouble after having talked to ICD, I would
be glad to help you out.

Oh, by the way: What you're describing also happens if you have a
corrupted DESKTOP.INF file. Try deleting your DESKTOP.INF and creating
a new one from scratch.

Rumoured to run at 32 MHz with extra circuitry.

> Is the Mega STE prepared for 2.88 meg drivers (can it support
> the high clock-freq to the AJAX-chip that is required?)?

32 MHz is available at the shifter.

> Can it read Amiga-formatted disks if programmed properly?

Unless it has completely new functionality: No.

> (the WD1772 couldn't because of hardware bugs, or?)

The WD1772 can't because it just works totally different than
the Amiga's disk "controller". The hardware "bug" you're referring
to is not the only reason why it can't be done. Another reason is
that the WD1772, as any other decent floppy controller, is index-
oriented, i.e. starts to read and write at the index position.
Tracks on Amiga disks may start _anywhere_, not just at the index
position, and may even cross the index boundary. This is completely
out of spec of most but the weirdest floppy controllers.

|> Has anyone managed to do this?

Easy: CS-TeX has a tool called GEMUTIL.PRG (call it with G in the TeX-Shell) that manipulates GEM.img files and creates a include-file for GEM images. The dvi output of CS-TeX can include GEM images with \special instructions. See what GEMUTIL.PRG creates as include file for more. You have only to \input the file in your .tex file at the position where you need your picture.

CS-TeX can also include GEM metafiles (*.GEM) and a special CS graphic format.

Happyly if you convert DVI to PS you have a portable file that can be printed on every laserprinter (with PS) (CS DVI with .img and .gem is _not_ device independant anymore).

I never use LC5 from its work-bench. Instead I combine LC5 with Gulam and GNU make, works find. Having come from MWC I too couldn't bear leaving the UNIX like environment.

Lack of debugger, (although the machine debugger is great), proper make, and profiler is a bit annoying.

>*** Roger W. Sheppard * Roger.Sheppard@bbs.actrix.gen.nz ***

I have used my SM125 of a period of around 4 years and the only problems
I have had are with the on/off switch - If you switch it off moving the switch
slowly then it makes a very unhealthy noise. In general I prefer the SM125 to
the SM124 because it has a tilt and swivel stand and the vertical size is
adjustable without opening up the case, allowing you to kill the border
that normaly takes up 1/3 of the screen. Also I have never had any screen
fading problems that seem to affect some SM124s.
I think I heard somewhere that the manufacturer had quality control
problems, but in my opinion if your monitor is still working at this stage it
is probably OK.
My advice if you are really worried would be to check the switch and replace
it if it seems dodgey, and when trying to sell it point out its stand and
twiddley knobs.

One way is to have a TSR code section to run programs and use the stack an a modifeid trap vector (5 is available among others) to message this from the desk accessory with the required prg. to run.
(place the program name + path on the stack, and issue a trap exception, the TSR doesn't have the malloc restriction on it and so can use Pexec()).

:[stuff deleted]

To get a 'significant speed increase' you need to buy one of the
accelerator boards WITH cache-memory. The best would be a 68030-
based board since they give you the best 'speed increase'.
Unfortunately they are QUITE expensive.

If you put in a cache-less speed-board (as I proposed) you won't
get a 80 percent higher performerance as with Turbo 16 or AdSpeed.
I haven't tried it, but I _guess_ you will only get 10-30 percent
speed increase with a cache-less board. However, it _could_ be
worth it since you already have a socketed processor. The things
you need is a 16 MHz (PLCC?) 68000 or 68010, some 74LS00 and
some other rather inexpensive logic-chip(s). All in all this
kind of upgrade costs about 35 USD in Sweden if you install it
yourself. I suspect the needed chips can be had for about half
of that in the US (Sweden is _very_ expensive).

```
1) version:

move d0,d1 4 n
add d0,d0 4 n
add d1,d0 4 n
add d0,d0 4 n
16 n

2) version:

move d0,d1 4 n
lsl #1,d0 6n+2n = 8n
lsl #2,d1 6n+4n= 10n = 12n (cause of gfxchip)
add d1,d0 4n
28n

> since shifts are faster than adds? (Just to be incredibly pedantic) :)

I nearly never use shitfs cause of the lack of speed. Every table-lookup
would be nearly as fast:

add.w d0,d0 4 n
add.w d0,d0 4 n
lea.l multab(pc),a0 8 n
move.l 0(a0,d0),d0 16 n
36 n

And with this method, you could use any fixed factor (i use it often in
gfx-demos and in my asm-mandel).

shifts only use less memory and less time, if used for 2^3 and more
that is lsl.w #3,d0. there the speed is the same as 3 adds, but
u use less memory (4 bytes instead of 6...).

So, for simple multiplications use add, for bigger sized with many 2^x
(x>=3 ) use shifts.

Read ya, Phil...

we are looking for a RAM upgrade for our 1040ST, to 4 megabytes. something
that uses SIMS would be best. our main board model # is
C070523-001 Revision D

thanks in advance
vic spicer

654. SM 124: Horizontal Centering?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-10 16:20:23 UTC
From: Jeroen.Scheerder@phil.ruu.nl
Message-ID: <2099@accucx.cc.ruu.nl>
Source record: 45599

Hi!

After successfully installing PixelWonder on my 520Stm (or should I say
Mega ST/3?) bumped into a tiny monitor problem.

I can achieve a resolution of 768x528 pixels, but when I do so the bottommost
<>30 pixels fall off the edge. So I'd like to raise the screen; about an inch
on the top side is still unused.

Opening up the monitor, I find potentiometers to do VSIZE, VLIN, SUB BRIGHT,
FOCUS, VCENTER, and an HSIZE coil of which the graphite core can be adjusted.
But no HCENTER!!

To me, it sounds incredible that a thing so elementary is not adjustable. So
I'm probably overlooking something. Can anyone out there shed a light on this?

Answers pleasy by email, I'll post an excerpt if ever there comes a reply.

A little note about PixelWonder, for the curious: PW is a graphics card, that
replaces the ST's graphic chip with a custom one, that is freely programmable.
It allows you to use MultiSyncs etc; and on standard SM1* monitors it allows
for selecting an equal amount of pixels at a ridiculuosly high refresh rate,
more pixels at the same refresh rate, or even more pixels at a lower refresh
rate. (price: DM 140, HFL 170 == US$ 80)
Examples:
* Everything runs in 768x528, 60 Hz;
* ... except Spectre, which is hardcoded for 640x400, but does work with PW
in 640x400 at 78 Hz;
* ... and except Tempus, which insists on writing to the graphics chip itself
and hence must run using the original hardware in 640x400 mode.

I'm no salesperson of Maxon, by the way. Far be it from me.

>of the ST/TT without doing dma. I would for instance like to issue a
>request sense command without having to reissue the command 4 times due
>to the buffering in the dma chip. Therefore I'd like to circumvent the
>dma completely for such short commands.
>Does anyone have any idea if this is possible?
I think it is possible: do not start the dma transfer after the last cmd byte and then get the bytes one by one. Wait between each two bytes for int as you normally do while sending command bytes. The dma logic should do the rest of the handshaking. This looks much like getting the status byte from the bus after dma transfer.
The host adaptor of my harddrive is the one of the german magazine ct, and this does work with it, but i am quit sure that this will also work with all other host adaptors.

656. Why does it do this?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-10 17:19:56 UTC
From: carl@syscon.rn.com
Message-ID: <1992Feb10.171956.18671@syscon.rn.com>
Source record: 45604

My 1Mb 520 / TOS 1.4 / BMS200 / ST251N system was connected to a tap strip. Flip on one switch and up she comes. 'Course you had to pop reset to reboot with the hard disk once you got the desktop since it didn't wait for the hard disk the first time. No big deal though. But I shuffled things a bit and it now has a Megafile 30 on it. When I turn the tap strip on, the Megafile gets so hosed that there is no way to make it talk. Reset doesn't help. The *only* way is to keep power off the 520 until the Megafile is ready to go.

Why is this?? What is going on??

I asked this a while back, no answer, so I'll ask again. What is the proper way (upward-compatible) to code your software to handle 24-bit color? Is their a way? And, if their is a way, what about alpha channels? Should we assume a palette? Or will their be another VDI call added to the system (yes, please)? I don't suppose somebody from Atari (Kbad, A.P.) would care to step forward and answer these allegations :-)? Guilty guilty GUILTY! The cow did it!

Can somebody tell me, or point me to directions on adding RAM internally
to a 520. I did this a few years ago with 256k chips, but I've since
lost the instructions. Now I have another 520, and can get 256k chips
very cheap. I've seen instructions for using sipps, but would like
to try the dipp route first (I'm cheap, ok :-). And 1 MB would be enough
for now. Also, other hardware modifications may become interesting in
the future, so is there a collection of this information someplace??

Hello,

you must run TOS 2.06 in your ST if you like to stick the 68010 into it. TOS
2.06 has the "move from sr" patch build in.

By the way: I'm searching for a 16Mhz-version of the 68010 (64 pin prefered)!
Please e-mail if you have any suggestions where I could get one!!

Greetings,
Patrick

664. Re: SM 124: Horizontal Centering?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-11 06:14:57 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <54324@cup.portal.com>
Source record: 45611

Jeroen Scheerder asked about horizontal centering of the picture on an SM124 monitor...

This IS adjustable in the same way the picture is centered on a regular TV screen.

Centering is controlled by magnets around the narrow neck of the picture tube, and are adjusted by a pair of disks with small handles protruding from them. By manipulating them (rotating the disks), the picture can be moved around the face of the CRT screen.

EXTREME CAUTION must be used, as the adjustment must be done with the power on, and the monitor operating, which causes VERY high voltages to be present. Anyone who's never worked with TV sets should probably NOT attempt this adjustment.

Another caution... in my SM124, the centering disks were glued to the glass neck of the picture tube at the factory. Breaking the seal to allow them to be adjusted could be very tricky, to avoid damaging them or the picture tube. The magnets are also quite brittle and can be easily broken.

The Focus adjustment should be touched up after moving the display...

Again... if you don't know your way around a high voltage system, find someone who does to do this adjustment...

BobR

Body handling: HTML body converted to readable text

volker@sfb256.iam.uni-bonn.de (Volker A. Brandt) writes:

>Please let us know what you find out and what you like/dislike about CS-TeX.

So my first impressions: INSTALL.PRG bombs when I start it (Mega STE4, TOS 2.05), no matter what accessories/AUTO-programs are loaded. Doesn't matter much, since the lharc I have is able to unpack the archives. Then I wanted to know how to get the dvi-drivers to use the Lindner folder structure. Since there is no readme on this, and the Shell doesn't even provide a possibility to set font paths, I had to read DVI_DOC.DVI. There wasn't a TeX-Source for this, and to read the DVI-File I needed the font setup working... Finally I read this using Lindner-TeX' previewer. Fortunately, the parameter line in the printer driver menu was exactly long enough to hold "-p=a4 -f= -f=lindner". So I was able to view DVI-Files. The TEXINPUT line in the ENVIRONMENT menu, though, is far to short to contain all the paths where I hide my standard input files. So this TeX is for command line use, but that's what I will do anyway. Then I tried to make a format file. I'm using my own version of latexg, which I call olatexg, and since the inputs for initex seem to be very different from those with Lindner TeX I had to hack up a olatexg.ini-file, which was easy. btw.. (Does "INITEX olatexg" look for olatexg.ini or for olatexg.tex, in other words, do I have to add ".ini" on the command line?) Then, INITEX bombed (two bombs). It did so, no matter what file I clicked, and it did so from a command line, even with no parameters. TEX did not bomb, but complain about format files not found. So I tried INITEX_H, but this told me I was out of memory (on a 4Meg STE with 3.3 Meg free according to Xcontrol). At least it didn't bomb, so this was a promising sign. I tried INITEX_L next, and it worked, and then I ran TEX_L on one of my files, and it worked, too, not slower, but certainly not much faster than Lindner-BigTeX. I still have to try it under Mint. I also have to try BibTeX, since the one delivered with Lindner TeX always runs out of memory if I have more than 2 bibliography entries.

From: oli@math.rwth-aachen.de
Message-ID: <oli.697806513@ernie>
Source record: 45620

Hello everybody.

I'm wondering whether there is a maximum length for cables connecting
Hard disks to the ACSI port of my Mega STE or to other drives, and if
there is a maximum total length between first and last device in the
chain. I wonder also if the ribbon connector connecting the hard drive
to the host adaptor may be long. It is maybe 5cm in my old SH205, but
I would like to fit a longer one. My SCSI drive is, if I remember cor-
rectly, on a 30cm ribbon connector, but then, it has considerably fewer
wires that the old MFM drive.

Only true on the 68000. I'm an old cycle counter from the 6800 (yes,
that is TWO zeros) days and vividly remember my shock when my assembler
version of strcpy ran *slower* than the library routine on an 020. Worse
yet, other changes in the test driver affected the speed! Seems that
though the code was tighter, execution time depended on how it landed
in the cache and whether the cache got flushed and ......
Oh yes. Under the right circumstances, my version was faster.
code was tighter

671. SCSI info Hardware/Software

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-11 15:08:59 UTC
From: thijs@titan.hts.hsa.nl
Message-ID: <1519@titan.hts.hsa.nl>
Source record: 45624

Does anybody have some information on programming the 5380 SCSI controller
manufactured by NCR or Logic Devices (or other manufacturers) ??

This IC is used in the atari TT030.

My goal is to write a device driver for this chip.
At the outside SCSI connector of the TT we will connect a device.
Our project group will design and build this device.

So, we appreciate info on the following subjects:

- Programming device drivers for TT (perhaps a sample source)
- Programming the SCSI chip in the TT
- Connecting hardware to the TT SCSI bus
- Protocol used by SCSI

We heard that the SCSI controller used in the TT costs about $15 here
in holland. Maybe it's possible to connect the same chip at the
outside of the TT to the SCSI bus ? Or does anybody know about a
slave SCSI chip which doesn't need a processor to do its job to the
external peripheral ??
The kind of device we want to connect to the SCSI port needs adress-
lines and data-lines. There are two adress lines, and 8 data lines.
The chip provides also two interrupt lines. (They can be shutt off)
The device is designed to be used on the processor bus of a computer.
We want to connect it using SCSI to keep it portable (to use it with
other computer systems).

Thanx in advance,
Thijs, Rob, Milo

672. WARNING!!! 3rd Coast Technologies

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-11 16:09:53 UTC
From: richardson@vaxr.sscl.uwo.ca
Message-ID: <1992Feb11.120953.1@vaxr.sscl.uwo.ca>
Source record: 45622

I felt it might be useful to post this warning about the service you can expect if you deal with the allegedly reputable Third Coast Technologies (UK). I purchased a 1/2 meg ram upgrade for my lowly 520st (whilst visiting England) but found to my dismay that the unit did not work when I returned to Canada. I called 3rd Coast and they said they would gladly replace it...great right? I sent off my unit and wiated...and waited...etc! I began calling them (long distance by the way!) and writing them...I even FAXed 'em! TEN months later (over 20 calls, 5 or 6 letters and 2 FAXes) I still ha not gotten my exchange.

Of course after the first dozen or so calls and empty promises of "it's in the mail" etc. I demanded a refund! they agreed to this...and I waited etc.! Does this sound ridiculous...try being stuck in Canada dealing with a Mr. Robey (spelling could be wrong...pronounced ROW-BEE) and being told on SEVERAL occasions by him PERSONALLY that you are being dealt with...LIES!!!

The tone of this letter is rather angry, but the best is yet to come.
i had friends visiting the vicinity of 3rd Coast so I got them to drop in and confront said gentleman. He was..surprise surprise...out to lunch. Another gentleman offered them a 'post-dated' cheque of some sort to which they refused. to get something out of the deal they simply took a replacement upgrade. The scenario now is that I have a ram upgrade I no longer need (I since got a SIMM upgrade from Evesham Micros...EXCELLENT) and am sincerely pissed off at 3rd Coast. If anyone can be prevented from making this mistake again I have done some good. If someone at 3rd Coast reads this check your files...
John Richardson.

Don't do that. It isn't really good for your system, and it certainly
doesn't agree with the MegaFile. It has to be ready and waiting before
the computer is turned on or you won't be able to use it. The only way
around this is to run AHDI again after starting the system. This is a
pain, and not really worth the effort.

674. Bug in Pure C?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-11 19:11:03 UTC
From: petcher@wuphys.wustl.edu
Message-ID: <1992Feb11.191103.11524@wuphys.wustl.edu>
Source record: 45623

If you compile the little program:

```
#define COM ,
#define A(args) args

main()
{
int i[] = {A(1 COM 2)};
}
```

with Pure C, you get a fatal error message something like "wrong number of arguments in A". Is this not a bug? I would expect an ansi compiler to accept macro expansion to more than one level.

Hello netters,

I have a related question too. You see I've written this ATZENTA program which is running fine under TOS 1.00 and TOS 1.02. Now one of the users whose ST has TOS 1.04 in ROM, reported that using gulam and passing arguments to ATZENTA does not work at all (i.e. the command line gets corrupted). My beta tester who also has TOS 1.04 tried to pass agruments via NeoDesk III (dragging the arguments over ATZENTA's icon) without sucess (i.e., corrupted command line).

On the other hand, on my system (TOS 1.02) I have tested it with Gulam, Mupfel, ksh, and Gemini (dragging the icons....) and everything works fine. This makes me suspect that MWC 's way of parsing the command line (i.e., argv mechanism) is incompatible with TOS 1.04 (or vice versa).

Is this correct? If yes, is there any patch for it? Actually, I 've ordered TOS 2.07 and it'll be here in a week so I can test myself... but even though I don't know how to fix the problem if it's still there...

thanks in advance...

676. Memory upgrading

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-11 21:31:52 UTC
From: vjrao@owlnet.rice.edu
Message-ID: <1992Feb11.213152.549@rice.edu>
Source record: 45628

I am about to get a 1 meg MegaSTE and would like to know what I would need to do to upgrade it to 2 or 4 megs. I understand that the MegaSTE uses SIMMS but am not sure what kind they are. For instance, does the 1 meg version have four 256K SIMMS in it, in which case I would have to buy two 1-meg SIMMS in order to go to 2 megs(and throw away the 256K ones)? Or does it have a single 1-meg SIMM in it (in which case I would only have to buy one 1-meg SIMM to go to 2 megs)? Also, what kind of speed of SIMMS would I need to get(80ns,100ns, 120ns,etc.)? Would they all have to be the same speed? Thanks in advance to anyone who answers my questions.

677. Extra keyboard or case ?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-11 21:43:34 UTC
From: hagelin@elixir.lne.kth.se
Message-ID: <1992Feb11.214334.23122@kth.se>
Source record: 45627

I have an Atari 520STe with a Megafile 30. The problem is that I think that the computer is very clumsy, and it would be better to have only the keyboard loose and the computer stored somewhere else. With a lot of cables running out from the back it's very diffucult to move the keyboard around (for instance, have it in your lap).

When I openened up the computer I found that the keyboard was connected to the main board with only 6 wires. This means that it would be possible to have the keyboard free from the rest. However you need a case for the keyboard and that's my question.

Does it exist (and do someone sell it) an external case for the Atari keyboard, that just can contain the keyboard and nothing else ?

If it doesn't exist, is it possible to extend the harddisk-cable to say about 1 meter, or can you silence the fan in the Megafile. The sound is driving me crazy !!

/Martin

>sells good for the ST, too...

Rumours! A friend recently puchased GFA Basic 3.5E and GFA Draft. He
asked GFA what their status is. They told him (this is paraphrased),
"We have a large installed base on the Atari that is profitable to
support, so we plan to continue updates and support".

BTW, my friend is VERY pleased with the software he received.

Now, let's move this out of the "tech" group, shall we?

What sort of information are you actually after? The ST is a lot more complex than the 8bit and their is a great deal more to learn on it as a result. Different books/docs excel in different areas.

680. Re: Sticking in a 68010

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-11 22:37:06 UTC
From: m91der@tdb.uu.se
Message-ID: <1992Feb11.223706.5299@tdb.uu.se>
Source record: 45630

On the subject of replacing the 68000 with a 68010:

There is a 16 MHz version of the PLCC 68010.
The name is FN12F-68010 (yes, 12 it says, but 16 MHz it is!).
I called my local chip-'outlet' up and checked with them (we're talking lazy swedish companies here) and they told me that they would have a look. Half an hour later they called back and told me that the 16 MHz version of the 68010 was impossible to get in Sweden. They had also called the factory in France, and they had no chips in stock. To start production they needed an order of 19 or more chips. That's way out of my league so I backed out.

If someone knows where I might get hold of a 16 MHz PLCC 68010 then PLEASE contact me (Email). I would really like to pop one into my Mega STE.

This thread started with someone that wanted to use a 68010 'for fun' and play with the loop-mode instructions. There are more differences than that:

DIVx is ~ 25 percent faster.
MULx is ~ 40 percent faster
Exception processing is slower (especially on Address and Bus-errors)
Most instructions that you should add EA-calculation times to CAN be faster depending on if a fetch from memory is needed or not.

If I ever manage to get hold of a 16 MHz PLCC 68010 I'll post a summary of how much faster it runs and how many programs 'die' under the 68010.

The connector to my ST238 here is about 1 m long, I don't have any problems
with it (except the ones because it's just an old ugly Seagate...).

Some docs for IBM machines say the ST506 connectors may be up to 3 meters
long, but I don't really believe this.

>

I had that same sort of troubles with Third Coast about 18 months ago with a
2.5 MEg upgrade & hard disk drive.. the HD took about 2 months to arrive and
the RAM upgrade 3 (to get a working version anyway).

My advice.. avoid Third Coast as long as you want a good service. Third
Coast aren't all bad, the receptionist (at the time of my order) was very
helpful and was getting pretty cheesed off with the rest of the organisation
by the time I got my goods.

I tried the above on our SunOS Unix compiler (ok, non-ansi but still pretty
good) and it dropped this in my lap ..

"x.c", line 6: auto variable i has size 0
"x.c", line 6: no automatic aggregate initialization
"x.c", line 6: illegal lhs of assignment operator
"x.c", line 6: warning: illegal combination of pointer and integer, op =
"x.c", line 6: illegal lhs of assignment operator
"x.c", line 6: warning: illegal combination of pointer and integer, op =

So maybe the faults do not lie in the compiler ?

Dom De Vitto

Could someone please answer this query :

I see that the monitor socket has pins for audio out and in. The use of audio out is obvious but putting a signal on the audio in just outputs it through my tv speaker. I presume there is some way of reading the information on this input. Any info on this would be apreciated.

David.

What you need to do is get a program called sleep.arc from the utilities directory of atari.archive.umich.edu. The instructions tell you what to do, but basically you name the unarc'd program sleepXX.prg and put it in the auto folder of ypur boot FLOPPY disk. The system will boot from the floppy run the sleepxx program delaying XX seconds allowing your HD to come up to speed and then it reboots from the HD. You pick the value of XX to suit your HD needs. Thanks to Steve Yelvington for this great program.

>to accept macro expansion to more than one level.

I suspect that your trying to do variable arguments with #defines.

What you want is

1 COM 2 'passed' to A as args

but PureC 'passes'

1 , 2 to A

To me the way PureC handles the affair looks more 'what you expect to happen'.
I think there are two philosophies at play here, one: substitute as early
as possible, the other: substitute as late as possible.
I think (*) this implementation choice isn't specified anywhere, so its up to
the compiler writers. It has nothing to do with macro expansion 'depth'.

BTW, use a static for i. It's more portable
Neat trick though...

Nat!

(*) based on Harbison/Steele as I understand it

692. How do you create an extended format using the system calls?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-12 18:20:32 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <XgN2FB1w164w@ersys.edmonton.ab.ca>
Source record: 45446
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am writing a program for the ST that has a "Format Disk(s)" option, which seems fairly simple. Or rather, it is a fairly simple task as long as you stick to the path given and do no try anything different. What I would like to do is format disks using an extended format (82 tracks/10 sectors). The documentation I have doesn't say how to do this, but I'll show what it does say about normal disks and then make some guesses. If I am wrong about something, PLEASE tell me. I would really appreciate any help anyone could offer. Now, to format a normal disk:

1. Use XBIOS #10 (FLOPFMT) to format track 00, 01, 02, 03, ..., 80 for both side 0 and side 1.

2. Zero the first two tracks of the disk. It doesn't say how, though.

(Good docs, huh?) :)

3. Use XBIOS #18 to generate a boot sector.

4. Write the boot sector to track 0, sector 1, side 0 using XBIOS #9 (FLOPWR).

Apparently, that should make a double sided (or single if you only do side 0) sided disk. As for zeroing the first two tracks, I guess they thought it was too obvious to bother explaining. (Grrr.....)

Now, here is where the problems arise. Step 1 seems easy enough to alter for an extended format, and step two shouldn't pose a problem once I figure out what they mean by their instructions. Step three is a major problem, though. This call expects four parameters. The first is the buffer that will hold the boot sector, and the second is a serial number (which is supposed to be randomly generated if you pas $01000000 as the parameter). The third parameter can only be one of five choices. They are:

-1 = Leave Alone
0 = 40 Tracks/Single Sided
1 = 40 Tracks/Double Sided
2 = 80 Tracks/Single Sided
3 = 80 Tracks/Double Sided

Since an extended format doesn't match 0-3, shoudl I choose -1? And how come they told me to format all 80 tracks in step one for a singled sided disk if it only has forty here. I always thought a single sided disk had 80 tracks, but only one side whereas a double sided disk was the same thing but the drive mechanism could format the other "side" as well. Anyway, this is the major stumbling block that I can see.

Any help would be greatly (REALLY GREATLY) appreciated....

It works fine as is using gcc version 1.40 on a Sun sparcstation under Sunos 4.1.1.

Craig.Graham@newcastle.ac.uk (Craig Graham), answering a question about running programs from a DA, suggests:

|(place the program name + path on the stack, and issue a trap
|exception, the TSR doesn't have the malloc restriction on it and so can
|use Pexec()).

Writing a DA that reliably runs other programs is a tricky business. Some people have done it reasonably well, but I've never tried, so I wouldn't know how to tackle the problems that come up.

However, I do know that any memory allocated by a trap handler, or any TSR, for that matter, is still owned by the process that calls the TSR. A trap handler that does Pexec on behalf of programs is just a very complicated GEMDOS binding. It's probably not a good way to launch programs from a DA.

Message-ID: <1992Feb12.221236.9291@usenet.ins.cwru.edu>
Source record: 45445

HI!

Does anybody of you have any experiences with the VDI "exchange
vector" services vex_timv, vex_butv, vex_motv and vex_curv?
What I don't know is which parameters expect the interrupt
routines that are installed with these services and what they
have to return.

At the moment, I am writing an AES extension that lets GEM
applications multitask under MiNT. I need this information
cause I consider eventually rewriting the whole AES event
handler (that busy-waits for events and takes up a considerable
amount of processor time).

Thanks,
Michael

SIMMS go in pairs, so you will nead 2, 1 meg by 8/9 bits, I don't know
if the Rams run faster in the 16 mhz mode of a MegaSTE, but the old
STE's used the slow 120 ns ones..

Check the printing or your SIMMS for the speed info, after the part No.
you should see a -80 or a -120 this is the speed info...

There are lots of PD program that can fix this small problem, these are run from the floppy as the Atari always boots the floppy first, or times out if no floppy..

Most of these programs just put a delay into the booting of the hard drive, this is done by holding the boot of the floppy for some preset time, this alows the hard drive to get up to speed..

Have a look on A.A. or GEnie...

Source record: 45455

Could some one from Atari Please E-Mail me scan rate information for
the TT monitor.

This is because the Atari TT monitor is not imported here,
there is a monitor supplied but it does not give the correct aspect ratio.

It is rubish, its just a standard PC VGA one and does not help sell
the TT at all.

So some help on this would be appreciated.

So Please help us to help you..!, Atari support here in NewZealand is NILL..

>yet? I am running tos 1.6, but you knew that already...right?
>
I'd suggest buying an AdSpeedSTe from ICD for $260, that's what I did. (Not positive on the price, it's in the ballpark tho.) Gives you a 16 MHz 68000 with cache, and a socket for an FPU.

The chip says MC68HC000FN16, surface-mount style. It would be nice to have a 68010 or socketed version of this board, but the one I have is mounted directly. Unfortunate. But, as has been mentioned before, Motorola doesn't make a 68010 rated for 16MHz, only for 12MHz. I guess there are other companies licensed to make 68000 family parts, I wonder if any of them make a faster version of the '010...

Nope, you presume wrong. The audio input is simply mixed with sound chip output
and appears on the audio out pin, never appears in any software-accessible form.
You'll need extra hardware to feed audio in. Simplest is probably by putting an
A-D converter onto the cartridge port...

The faults produced by the standard sun cc comes from the fact that
initialisation of auto arrays is not supported. Add static and it works!

The sun ANSI C compiler (acc, unbundled == $$) has no comments.

705. HDX sucks

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-13 10:08:02 UTC
From: elendir@inf.enst.fr
Message-ID: <904@clbull.frcl.bull.fr>
Source record: 45466

Hi !

My Hard Disk recently made a bad fall... from my table to the floor below. In brief, there happened to be some kind of crash.

So I decided to run HDX to mark the bad sectors. However, each time I run it, it founds new bad sectors, and leaves some other defectuous ones unmarked : "Moralite :" I have from time to time a message "The data on drive C: might have been corrupted..." and the file is destroyed.

Thus, this is my question : Does anyone out there know about a REAL GOOD HD manager which would detect ALL bad sectors in one pass ? I'm becoming a bit fed up to copy files from a disk on faulty sectors that HDX has not detected...

Thanks a lot,

Vincent.

PS : Please use EMAIL rather than postings. I should now get a faster news access, but that's going to take 2 or 3 days... Thanks again.

PPS : I run HDX V 5.00 if that helps.

Well I didn't understand Harbison/Steele. They specify (and I believe 'em)
that macro substitution is ONLY performed on the body of a macro. So this
is a bug in PureC. Since PureC does the substitution already on the arguments.

Nat!

From: knop@duteca.et.tudelft.nl
Message-ID: <1992Feb13.110727.25754@donau.et.tudelft.nl>
Source record: 45460

thijs@titan.hts.hsa.nl (Thijs Kaper) writes:

>Does anybody have some information on programming the 5380 SCSI controller
>manufactured by NCR or Logic Devices (or other manufacturers) ??

NCR has it and you can/should ask them.

>This IC is used in the atari TT030.

and in many, many other SCSI computer interfaces...

>My goal is to write a device driver for this chip.
>At the outside SCSI connector of the TT we will connect a device.
>Our project group will design and build this device.

>So, we appreciate info on the following subjects:

>- Programming device drivers for TT (perhaps a sample source)
Can't help you with that... If other devices than your project may
be connected to the SCSI bus at the same time, you have to use the
driver that Atari provides (or extend this). When no other devices
are connected, you are can violate the SCSI specs as long as you do
not endanger the hardware...

>- Programming the SCSI chip in the TT
This should be very similar to any other I/O in the TT. If it is
anything like the ASCI bus in the ST, you can only access the SCSI
bus through the DMA controller, which complicates things somewhat.

>- Connecting hardware to the TT SCSI bus
There are several different approved connectors for SCSI buses and
many manufacturers invent new ones that are totally incompatible
with anything else. You'll need a connector that fits in the SCSI
port of the TT. What you put on the other end is your choice.

>- Protocol used by SCSI

The SCSI protocol is described in the "What is SCSI?" book from
NCR published by Prentice Hall. (I don't have this book, this
info comes from an article in comp.periphs by John Lohmeyer that
I saved years ago.) ISBN # 0137968558.

>We heard that the SCSI controller used in the TT costs about $15 here
>in holland. Maybe it's possible to connect the same chip at the
>outside of the TT to the SCSI bus ? Or does anybody know about a
>slave SCSI chip which doesn't need a processor to do its job to the
>external peripheral ??

I think you are in trouble here. The SCSI bus was intended to connect
intelligent peripherals to computers. The minimum requirements of
an SCSI peripheral are such that it is not practical to implement one
without using a processor. Of course, if you violate the specs...

The NCR 5380 directly connects to the SCSI bus. However, you'll need
to terminate the bus. This is described in (almost) any SCSI document:
Each signal wire in an SCSI bus must be terminated at both ends with
two resistors: 220 Ohm to +5V and 330 Ohm to GND. I don't know whether
the TT has one terminator built-in.

>The kind of device we want to connect to the SCSI port needs adress-
>lines and data-lines. There are two adress lines, and 8 data lines.
>The chip provides also two interrupt lines. (They can be shutt off)
>The device is designed to be used on the processor bus of a computer.
>We want to connect it using SCSI to keep it portable (to use it with
>other computer systems).

If you want to operate it from different computers, you will need to
write an SCSI device driver for each computer... There is no such thing
as an SCSIopen call in any programming language that I know of...

If the bandwidth you require is less than 1 kByte/second, might I
suggest that you use RS232C instead ?

> Thanx in advance,

Such a program wouldn't work on TOS <= 1.04 because in these TOS versions
the line f opcodes are misused by the AES.

713. Getting software into a SOFT Mac emulator

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-13 14:01:26 UTC
From: smee@bristol.ac.uk
Message-ID: <1992Feb13.140126.16974@bristol.ac.uk>
Source record: 45462

We've got a grad student with a problem, and I'm hoping someone can help. If you've got an answer, please try to make it simple, as the student is not a programmer, and I don't know anything about Macs.

Problem is that he is running a software Mac emulator on an ST, and he has a package he needs to transfer from a Mac to the ST. It's his belief that in order to pick up the 'attributes' file (or whatever it's called) which is associated with the package, he first needs to use 'stuffer' on the Mac, and then to 'unstuff' the package once he's moved it across.

However, the problem then becomes recursive, because he doesn't have the unstuffer on the emulator -- so it would presumably need moved across as well. Can anyone provide a way of resolving this deadlock? If it helps, we can get at a networked Mac, and also at a networked ST though not one running Mac emulation, just vanilla ST. While we can't make these machines talk directly to each other, we should be able to stage transparently through a Unix box.

Source record: 45473

Does anyone out there know where I can get hold of circuit diagrams
to help me put in a 68010, running at 16 MHz - I just want some speed up (I
expect to get 30-50% speedup in reality). Its not worth my while buying
a card for 130 pounds. I really only want it as a cheap way to speed up
using g++.

If anyone manages to get some details, can you tell me if you've
built one yourself, and if its compatible with everything (I gather that
before TOS 1.6, the bootup procedure won't work on a 68010 - can I just
swicth it to 8Mhz or something, and then speed it up later?).

Thanks in advance,
I will summarize to the net any responses I get.

Andy.Stratton.

Source record: 45463
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,de.comp.sys.st

Hi there,

I ran into a problem which is very disturbing...

I cannot achieve to start GEM programs under MiNT/tcsh; even after
changing to the path where the application is at home with all files
I get a dialog box which says: 'Cannot find RSC-File'.

I already tried to have the PATH also set to /rsc and to place there
all the RSC's which can't be found, didn't work...

Next, I tried to change to the path where the GEM application lives and
reset the path to"set PATH ."; was useless...

I'm using a TT030/6/200, Mint 0.92, tcsh is Eric Smith's port of tcsh 6.01.00

Any good advice???

greetings Bernhard

Would monkeying with the _root pointer (making it point to your
own basepage instead of the current processes' basepage, then
correcting things after the malloc() call) make any difference in
this scenario? (Oops! I meant pexec() call!) Since you're
(supposedly) cleaning up any damage before you return to the "main"
process?

>Don't do that. It isn't really good for your system, and it certainly
>doesn't agree with the MegaFile.
First, thanks for the reply. But why isn't it good for the system?
I have three other computer that work fine that way. The one in question
used to before the Megafile. I know it doesn't agree with the Megafile -
the question is *why* doesn't it? The same technique (which I assure
you should not be 'bad for the system') works with the BMS200/ST251N
combination.

> It has to be ready and waiting before
>the computer is turned on or you won't be able to use it.
Why? The BMS200/ST251N doesn't have to. Nor do my ST296N or PRO210.

> The only way
>around this is to run AHDI again after starting the system. This is a
>pain, and not really worth the effort.
And besides being a pain, it doesn't solve the problem. The Megafile
is too hosed to respond to a second run of AHDI. It has to be powered
off to recover.

Any more suggestions? I really do appreciate the effort. It seems
like there must be some hardware techies out here in netland.

>case, I think the '020+ chips have more pins than the vanilla 68k, so they
>wont even fit in!

I have in front of me a small circuit board which takes a
68020 and maps it onto a vanilla 68000. It uses 3 pals and
has space for what I beleive is a co-processor.

It is identified as:

"A P.C.Dium Design for CSA"
"CSA 68020/68000 ADAPTER 00724A"

I have yet to try it in my ST, however, we've used a similar
approach in one of our past projects where we replaced the
68000 with the 020 using a plug in board. Worked just fine.

The question here is also software compatibility. The 68000 code
should run just fine on the 68020, shouldn't it? If you want to
make use of the added horsepower, however, you will need the
higher versions of TOS (according to above message) or resort
to writing your own code. (ie. The Manx Aztec compiler
has an 020 switch.)

Has anyone tried any of this?

> -- adam

Yes there is, its called KA9Q and can be found on a.a.u.e. i do
believe. It actually works well. We had setup "cereal net"
with 5 computers running over everything from null modems to
2400 baud modems and it worked quite decently. (Although,
the way we had it set up, it was like a straight line so to
get to say machine #5 you had to go thru #2,#3,#4 (if you were
#1 that is). ping times of approx 1sec from one end to the other.
the setup looked like this:

FruitLoops CapnCrunch LuckyCharms Honeycombs Kix
1040ST----24b--->386-------56kb-->386Laptop--24b-->386--15kb->386

It was fun. I hope you enjoy your Serial Net as well!

There's really nothing to the standard replay format. It has a one-byte header which is the speed. Values range from 1-5 (I think) and correspond to the canned frequencies in the sample rate menu. The rest is just data, and it's 8-bit unsigned magnitude; i.e. exactly the format of the samples on atari.archive and most everywhere else in the ST world. You should be able to play replay samples with play.prg and other programs on a.a "right out of the box."

The GEMDOS Pexec-call returns long-negative values if a program failed, e.g.
-32L if the user pressed ^C. The GEMDOS Pterm-call accepts only short arguments
and doesn't sign-extend them. So the user has no way to return long-negative
values to the Pexec-caller (at least without changing the GEMDOS return value
in an etv_term handler - but people doing this know what they get).

726. Spectre GCR test: is it the drive or the floppy?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-14 21:23:57 UTC
From: rcd@cbnewsj.cb.att.com
Message-ID: <1992Feb14.212357.4753@cbnewsj.cb.att.com>
Source record: 45476
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

The Spectre GCR test always blames the _drive_ if it has a
problem reading (or writing) a track. However, my experience
suggests that my drive is fine, its how the data is written on
the floppy that causes problems.

I know this seems weird, but I can almost fill up my floppy
(say, up to 760K) with a lot of small files, and the GCR test
runs fine. However, if I put one big (say, 680K file) on the
SAME floppy in the SAME drive, I get "The file foo could not be
read, and was skipped" in Mac mode, and a read error in the GCR test!

The problem usually occurs in the inner tracks rather than outer.
I don't think it's a drive or shielding problem, since it happens
on both my external and internal drives.

I work around this problem by running the large file through Compactor
or Stuffit. Has anyone else experienced something similar? Fooling
around with the pot in the GCR didn't make any difference.

Also, is it safe to use floppies formatted and written to on a Mac running
System 7 in Spectre GCR? I got a "This drive needs minor repairs"
message the first time I tried this.

Thanks,

Rana Dutt

From: elvis@watnxt1.ucr.edu
Message-ID: <20180@ucrmath.ucr.edu>
Source record: 45477

Hi,
Well news seems to be getting off campus finally, so I thought I'd take another crack at posting this:

I've been contemplating putting my 1040st and hard drive into an AT style case, so that I'd have a tad more room. I was wondering if anyone has any suggestions about doing so. The thing that worries the most, I suppose is the power supply. It would be nice to have one supply power both the computer and the hard drive, but don't know if a standard power supply could do that. (I know it would work for the hard drive, its the ST itself that I'm not sure of...). Anyways, if anyone has any suggestions about this, or has done it themselves, I'd really appreciate any help you can offer.

Thanks,
Andrew (watkins@ucrvms.ucr.edu or elvis@watnxt2.ucr.edu)
(mail to watnxt3 (where I'm posting from) doesn't work...)

728. Re: Assembler to gas converter?

I assume one wants to convert the assembly source code in Motorola syntax
to MIT/SUN3/Unix syntax. Well, one can do thant using 'sed','awk', or
'ed' to a certain extent (I once used the 'awk' myself). But honestly,
the simplest way is to re-compile your GNU Assembler, choosing the
right options (elect Motorola, for example). And remember GNU C can
output the results in Motorola syntax as well by recompiling it with
'Motorola' option selected.

At what speed did your previous project run? CSA makes a number of products, but they tend to focus on Amiga accelerator boards. If the little board you have there is like any of their other boards, it will only work with the 7.16MHz Amiga clock speed.

But, ya never know, they might have actually made a more generic solution. Best way to find out is to plug in and try it...

This question has already been asked and answered a number of times. While it's true that the higher numbered processors tend to be supersets of the previous models, there are lots of differences in behavior. TOS versions older than 1.06 will not be able to cope at all.

During the recent discussion of various compilers and debuggers for the Atari, someone mentioned that there was a fix for the the db.prg (a UN*X adb style debugger) program distributed with the Mark Williams C system which ``permitted'' the program to run using the ``Rainbow Tos'' (1.04). Someone mentioned that the ``fix program'' was available on the Atari Archives.

I hunted around atari.archive.umich.edu but did not recognize anything that resembled such a program. If anyone on the net knows the name/location or has a copy they could/would send me (uuencoded?) I would appreciate it.

By the way, I have run MWC with TOS 1.04 without problems. I mostly use gcc now, though, since I run MiNT (0.92) (Thanks all, it is great) and have 4MB memory. Recently I compiled the text utilities from the Free Software Foundation with gcc under MiNT with the MiNT libraries. The total changes included adding lines for _stksize to three of the programs and fixing a system include file to not duplicate option parsing definitions. I used the configuration process which came with the system (under Bash) and compiled away. It was remarkable how easy the whole process was.

Source record: 45487

I have got Sozobon2.0 running on a MINIX box (no ST !!). There are still some oddities I'd like to discuss. Is anybody out there also using Sozobon on a 68K based MINIX that is willing to talk to me?
Furthermore I have followed with some interest the discussion about the differences between Sozobon2.0 and Sozobon1.33. The Sozobon1.33 optimizer and assembler are said to be much better than in Sozobon2.0. I would really like to try them (on my minix-box), but would need source code then.

Hello Stephan,
there is an Version of TC 2.0 (no C++) on the Atari. It has been sold by
Borland Germany, but now it's sold by 'Application Systems' (another german
company) and called PureC.
I don't know if there is an english version.

Hope it helps,
Thomas

>and PMMU running in a ST.

Actually, when the 68010 was introduced, Motorola was pushing the 68451, a *segmented* memory management unit. I'm not sure the 68551 can work with a 68010. (Not sure it won't, either. After all, the "coprocessor interface" was designed for 68020, but you can still use the FP coproc in "peripheral" mode on a 68000 or '010.)
>
> "Why don't I just wait for a 68030 upgrade board to come out?" you

>$1200!!! (I could be a 386sx system for this much.

Yeah, but a 386SX wouldn't be anywhere near as fast. Ya get what ya pay for. A 386SX is only marginally superior to a plain 68000; it's similarly hindered by a 16 bit data bus...
>
> I want to stay with my ST, and I want to take advantage of software
>that requires a PMMU. (I wonder if ASV would run on a 68010/PMMU ST?)

That's tough. I would expect not. '020s and '030s are sufficiently different from 68010s that you'd need to do some rewriting...

Hello!

Yesterday, my friend Volker killed a chip from 'Adaptec' in his 88-Syquest-drive. It seems to be the SCSI-controller, his name is 'AIC-6110 HQ'.

Is there everybody who knows this chip or at least an address of 'Adaptec', in USA or, by chance, in Germany?

Please help us, my friend is very down :-)

Bye, Michael

> make use of the added horsepower, however, you will need the
> higher versions of TOS (according to above message) or resort
> to writing your own code. (ie. The Manx Aztec compiler
> has an 020 switch.)

The major problem here is the MOVE from SR instruction, which is
priviledged on the 020 and not on the 68 K. I heard that there was a special
trap handler for this, but it its buggy if you do not own tos 2.00 or higher.

Be careful also, 020 has an internal cache, so auto-modified code cannot run
. (Especially games protection code).

Have fun,

Vincent.

737. A triad of questions: FD/Photofact/RAM

Newsgroup: comp.sys.atari.st.tech

From: slp9m@cc.usu.edu
Message-ID: <1992Feb15.144740.52728@cc.usu.edu>
Source record: 45491

First on floppy drives: Is there a good source of info on just what it takes to hook one up from scratch. Also, I have a spare 360K internal 5.25 drive removed from an IBM clone. Is there much involved in hooking it to my 1040ST? I know that a 3.5 double sided drive would be nicer, but this thing is just sitting here and I have no other use for it. Will it work in the ST without too much additional expense.

Second - what does anyone know about the SAMS Photofact on the ST? I would like to know more about the ST's hardware (I have NOTHING on it except the original manual which says next to nothing except for some pinouts.) Is this a good source? (I'm more interested in adding on hardware / interfacing than just repair data) Hosfelt Electronics is offering the 520ST photofact "on sale" for about $27. Is this a decent price? Is it worth the money? What about other sources of info on the innards? Any recommendations?

Lastly - on RAM upgrades. I remeber someone saying that atari.archive had 2 writeups on RAM upgrades. I found the one by Christopher Hicks. Does anyone know where the other is (if it exists?)

Thanks in advance, -SEP

738. HD problem solved...

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-15 20:51:09 UTC
From: rosenkra@convex.com
Message-ID: <1992Feb15.205109.29602@convex.com>
Source record: 45490

recently i inquired about a problem with an old SH204: the drive would
not initialize on power up (spun up, but no appearent head movement).
it was a failure, meaning it used to work (LUN 1, daisychained to
megafile 60).

i seem to have solved the problem by:

1) reseating everything that could be (socketed chips, connectors).
2) cleaning the dust out.
3) twisting the stepper motor shaft for the head through its
entire range (careful not to force at the ends of its travel).

the latter is probably what did the trick. i seems to have been stuck.
the stepper motor (at least that is what i think it is) is external to
the drive mech and has a shaft long enough to grab. full travel is like
1-2 revolutions. i forget which mech is installed (20 MB). now i have
GNU C back online. very :-). no apparent data loss (so far). immediately
backed it up.

hope this helps others...

739. Icons -- There doesn't seem to be a way to use them...!

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-15 23:05:39 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <5Nk8FB1w164w@ersys.edmonton.ab.ca>
Source record: 45495
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Here is a major stumbling block in my programming efforts that I never counted on. The ST provides such useful routines for doing most things, like menus and resource files, but all the information I have completely excludes the subject of icons. Since I have received such wonderful (and extensive) help from this newsgroup before, I decided to ask once again. What I have so far is a group of icons in a .RSC file that I would like to be able to place on the screen. Seems fairly simple, but you'd be surprised. The effect I am looking for is what you see in the GEM Desktop. Icons on the desktop. The reason they are in a resource file is simply because NeoDesk does it that way. A friend of mine took icons drawn by someone else (public domain from atari.archive) and loaded them into the NeoDesk Icon editor. Then he saved and went into the Atari RCS. From there he took the icons out of the NeoDesk resource and placed them in a seperate file. After all, the icons may be public domain, but no part of NeoDesk is. It doesn't matter how I get the icons on the screen, so long as I do.

Second note: Did my friend and I infringe on any copyrights by using the Icons (public domain) that were meant to be used with a commercial product? I hope not. If we did, I could always drw the icons by hand.

Well, uh, I for one got a HD so I wouldn't *have* to deal with floppies. :-)
I read a looong time ago about a hardware mod you could do that would hold
the RESET line active for N seconds during bootup ... I think it had to do
with a cap on the reset switch circuit. Since a schematic didn't come
with the DevKit when I got it (about 4-5 years ago), I don't know offhand.

Anyone heard of this?

>themselves, I'd really appreciate any help you can offer.

I've just finished the first part of installing my ST in a tower case (full
sized). So far it works OK, except that it has to go in diagonally since
the original ST motherboard is *really* large.

I suspect you might have the same problem with an AT case. Before buying,
open your ST and take measurements. Cut out a piece of cardboard in the
same shape/size, plus a little overlap, and check around for cases and see
if they will fit. Then mail-order.

As for power, I suspect a 150-200W power supply would do just fine, but don't
quote me on that. Check the power specs on the Atari and on your equipment
(use an ammeter if you want), and allow at least 50% more (more like 100%)
for whatever.

As for connectors, what I did was simply desolder them from the board and
run ribbon cable. The HD connector I kept, but bent the pins straight
(very, very carefully) and put back in. It's too hard to find 19 pin
connectors. In any case, I kept my host adaptor in the case as well (I
drilled a couple of holes to mount the host adaptor). For the keyboard
I'm using a DB9, an 8-conductor coiled "phone cord" (I chopped off the
modular phone plug connectors and stuck on two DB9's), and the original
ST case (I hot-knifed it so that it's a detached keyboard now. Kludgy
but it works. :-))

Improvise, it should work. I'll post instructions on tower case installation
when I finish and it works. :-)

The ST board is pretty long so you need a large PC case. I was starting to try this, but came to the conclusion that it was too expensive for me because my case was so small that I would have to get some new cables and make some cables to allow me to connect printers and whatnot through the case. The end result was that I put up some shelves and put the computer on it and got a DEKA keyboard adapter so I could upgrade the keyboard. I shoved the hard drive into the upper part of a clothes wardrobe so the noise from the fan is much less. I recently saw a relevant article on building computer enclosures in "Fine Woodworking." The project discussed was a desk with a built in space for a computer so it would not take over the desktop.

Message-ID: <1992Feb16.032844.3022@yuma.acns.colostate.edu>
Source record: 45496

The other option is to find a ST520, (note no f nor m, i.e. no internal drive nor the RF modulator, actually with modulator is not a problem). It's the smallest size ST motherboard which will give you more room to put stuffs inside the box. A full size(older version) has enough room for the 520 to seat flat inside. Nope, I've not done it yet, but will be doing it a few month as soon as I can get my current work done. Do try the dimension to check the space, I got a 280 watts supply from Timeline cheap and it's long retangle shape so leave more space for the ST to seat in.
Was worry about the connectors orientation will be hard to access, but the suggestion of desolder them and run flat ribbon cable to remount them on the back of the case sounds a good way.

>partitions. That would only be 256meg...

This is not correct.
Even TOS 1.00 supports partitions bigger than 16 MByte if you're using
a newer (>= 3.02) AHDI.
AHDI simply increases the _logical_ sector size to keep the nuber of
sectors below 32768.
The number of partition is limited by GEMDOS, which currently supports
only 16 logical drives; since the first two are always floppy disks,
there are 14 drives remaining...

>Even using tos 1.4 or newer would only allow you to use a little more..
>16 partitions of 32meg or roughly 512meg..

The maximum size of a single partition is something like 512 MByte or
1 GByte (I don't know at the moment).

[...]

By coincidence I found that when there is no floppy in the drive and I
turn on computer and HD simultaneously (in fact, I've got everything
hooked up to a common power switch), then the computer tries to access
the non-existent floppy just long enough for the HD to spin up. It
then gives up on the floppy and boots from the HD, just as desired.
I don't know if this is coincidence or not. I've got a MEGA ST running
TOS 1.04, and a MEGAFILE 30.

(If there just happens to be a disc in the drive, it boots from the
disc and the HD hangs when it is spun up. However, in this case it's
enough to do a warm reboot).

Grab "sed" from atari.archive - I've got a sed-script at home that I used
to convert a few of my old subroutines to gas (well actually, to inline
asm(), but that's the same thing) - I'll post it.

If you are using one that checks for the SCSI ready of the drive, this
will cause it to hang up, use one that just has a delay and dose not poll
the drive...

749. Trouble adding a second SCSI drive

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-17 06:57:40 UTC
From: jeffreyb@netcom.COM
Message-ID: <1992Feb17.065740.4437jeffreyb@netcom.COM>
Source record: 45501

I was hoping someone out there might be able to help me. I am trying to connect a second SCSI drive to my Atari ST. I already have a 30meg Supra Drive that has a Seagate ST138N in it and am trying to add an 80meg Maxtor 7080SR. I have done the following:

1) Removed the terminator from the ST138N controller.
2) Set the SCSI id in the Maxtor to 1.
3) Cabled the drives so that the Seagate was first on the chain and the Maxtor was last. The Maxtor does have its terminator intact.

Using the Supra utilities, I was unabled to get the Maxtor to be recognized (the Seagate still worked fine). Every time it tried to access SCSI id 1 the Maxtor would spin down and then back up. The utils would then indicate that it couldn't find a device at that address, but obviously the Maxtor is receiving something.

I also tried reversing the ids and cabling. This resulted in the same situation.

Any help would be greatly appreciated.

750. ** GDB troubles HELP !!**

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-17 07:51:00 UTC
From: laurent@hpgnd.grenoble.hp.com
Message-ID: <1410003@hpgnd.grenoble.hp.com>
Source record: 45658

Hello !

A while ago I have started to work with GNU C on my ATARI STE 4Mb. I'm very happy with the compiler (version 1.40) but, in spite of all my efforts I'm still unable to make the debugger gdb work.

Here is the symptom: let's assume my C program is called try.c. Here is what I do

```
1 - gcc -c -g try.c
2 - gcc -o try.prg try.o -lgnu
3 - sym-ld -o try.sym $(GNULIB)\crt0.o try.o -lgnu
4 - gdb
5 - exec-file try.prg
6 - symbol-file try.sym
7 - b main
```

Up to here everything is Ok. gdb starts fine and accepts my breakpoint gently. Then everyhting goes WRONG : if I issue a "run" command here is the message I have ->
"Program received signal 0, null"
"0x11c1a8 in _start()"

If I persist and type in "run" command again gdb crashes (2 bombs). I have removed evrything in my AUTO folder and the problem is still there. The version of my debugger is 2.6 (patchlevel 14).

Please HELP ME !!!

Many thanks to all of you.
Laurent JULLIARD
laurentj@hpgnse2.grenoble.hp.com

> Be careful also, 020 has an internal cache, so auto-modified code cannot run
>. (Especially games protection code).

The cache is write through though so it should have no affect on the application if it is doing self-modifing code. A problem could show up though due to the extra speed. But the Mega STE and TT will suffer from this also.

From: neil@cs.hw.ac.uk
Message-ID: <4657@brahma.cs.hw.ac.uk>
Source record: 45508

Well I've played a bit more with the STE's paddle input and quite frankly
I'm not convinced they work at all. Just a big lump of bogus hardware.
Nobody who has tried them seems to have had any success. I've tried a
pot across the supply with the sweep to the input and just the pot from
sweep to ground or 5V. Nothing doing. Anybody else got ideas on this?
Atari UK have no idea about them!

I've also been playing with the light pen input with limited success.
I'm using a Honeywell Sweetspot device. This works only vertically.
Horizontal values just toggle between maximum and minimum.

I'm beginning to understand why these ports don't exist on the Mega ST and TT.

Source record: 45505

Does any one know were I can find any PD Signum Fonts, (SiFox) like FTP sites. ?

I have just got a copy of Script the USA version, well this is all they
sell here in NewZealand and at a very good price.

But in the Font suplement it mentions about converting the European Fonts
to USA ones, but I can't see the reason for this..?

Also can I obtain a English Dictionary for it, it comes with a USA one..

I did read some were that there is no English Dictionary out for the
English version of Script..Thanks...

756. Re: The Parallel Port: Speed?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-17 14:05:24 UTC
From: ttonino@bio.vu.nl
Message-ID: <1992Feb17.140524.3331@bio.vu.nl>
Source record: 45506

The rather low speed of the parallel port on the ST is caused by the rather convoluted ROM software, as for every character a check is made whether is should be output to serial or parallel.

A program like Calamus, doing its own output directly to the port is much and much faster (about 4 times).

I don't know of readily available speedup software, but it should be possible, to a degree.

Thomas Tonino
Cheers to the world

>
>and this need 26 Takt
```

I suppose you mean 26 clock cycles. Well your 68000-'referenz-book' doesn't apply to STs. Many of the documented times in the MC68000 handbook, or S68000 handbook are different from those on STs. This includes shift instructions, and branch instructions among others. In this case the code takes 28 clock cycles due to lsl #n,.. being rounded to the next highest multiple of 4 on the ST. (If you get these times wrong in linear code like for no-border routines, your program just doesn't work so it is important).

758. Death of the Archives...PLEASE READ

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-17 16:19:11 UTC
From: sjg@terminator.cc.umich.edu
Message-ID: <1992Feb17.161911.14621@terminator.cc.umich.edu>
Source record: 45663
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I am posting the following email with permission from the author.
It talks specifically to the users of the mac archives here at
U of M but it also applies to those of us who utilize the atari
archives as well.

Dear mac-archive-user....

I have some very very disturbing and shocking (at least for me) news
to relay to you....

Due to budget constraints at the U-M Information Technology Division,
a tenative decision has been made to cut and cease support of the largely
volunteer archive service (i.e. mac.archive.umich.edu,
msdos.archive.umich.edu,
next.archive.umich.edu, linguistics.archive, atari, etc.).

Here is a copy of the message I received about a half hour ago
from my supervisor on the project:

Message-Id: <9202140448.AA08771@terminator.cc.umich.edu>
To: all-archivists@terminator.cc.umich.edu
Subject: Death of the Archives?
Date: Thu, 13 Feb 92 23:48:01 -0500
From: "Fred Swartz" <swartz@terminator.cc.umich.edu>

... ...I don't know exactly how this will
affect the 0.25 part of Allan and Mike that RS pays for, perhaps CSS
and CITI will pick it up. I'll let you know when/if I find out.

When I talked to Mike Clark (my manager in Research Systems) about
continuing the archives on volunteer power (as it largely runs right
now), he was very negative on the idea, but failed to supply a
convincing argument for abandoning it. I'm stunned and upset.
The Archives have managed very well on volunteer effort up til now and
it seems to me that something else is going on other than a genuine
concern for serving the users.

I don't know what this means for the Archives, although they aren't
going to be turned off tomorrow. I'll let you know whatever I find out
as soon as I can.

-- Fred

I talked on the phone with Fred and we both agree that this decision seems very unfair to both the students/faculty who use the archives here at the University of Michigan, and you... the users on the Internet, Bitnet, UUCP, etc.

To me, it doesn't make much sense to cut off support for the archives. Both I and Allan make around $70 a week working on the archives (I work on the Mac side, he works on the msdos side).. the rest of the time we spend is voluntary, like the twenty or so other people who add/keep up the archives here. The archives are probably one of the most popular and beneficial services that ITD offers. There may be other ways to trim the budget, but cutting off something that costs nearly nothing to begin with doesn't seem very wise.

Please help us out. E-mail in support of our archives can be sent to archive.support@mac.archive.umich.edu. We don't want to flood the senior managers' mailboxes, and we're still thinking about what we can do to save our archives. Comments can be sent to us at "comments@mac.archive.umich.edu". To address the entire archive group, you may send e-mail to -"all-archivists@terminator.cc.umich.edu".

Thanks....

mike@mac.archive.umich.edu

---

as of now, I am unsure whether we have corresponding groups set up for our side of things, but you can certainly send your support to all-archivists@terminator.cc.umich.edu

thanks,

Susan

759. Ghostscript on STE Dies

760. 9600 baud modem troubles

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-17 17:26:53 UTC
From: be824@cleveland.Freenet.Edu
Message-ID: <1992Feb17.172653.21068@usenet.ins.cwru.edu>
Source record: 45509

I could not find anything like comp.modems or anything, so I figure
somebody in this group could maybe help me. My 9600 baud Concord
Data Systems V.32 Trellis modem is just fine for downloadg, or
receiving characters, but when you type , or try to upload
something, you're headed for trouble. There is a very predictable
glitch. If you are typing on a mainframe in full duplex so that you
see the characters that come back to you, and you hold down the
space bar, you will find that every 256 charactersthat it is it will
print a 0 instead of a space. What's really interesting is
that that is 16 decimal more than a space. Is there anything I
can do about this?
-steve <selick@csa.bu.edu>

It would work with the 68010 because you can use the MOVES instruction to
handle coprocessors like the FPU or even a MMU - connected to the coprocessor
bus.

Any hardware freak out there...?

Well, I started doing this last semester. As far has I got now,
I've got the motherboard laying bare on my desk, with the keyboard
hooked up to it. I just haven't found time to finish moving it into the
case. The reason I got this far was the fact that my Power Supply died
on my ST, so I got a hold of a PC case and PS for free, and I wired the
PS into my ST. So far so good!! (It also has a switched outlet on the
back for the monitor, so when I throw the power switch, it also turns on
the monitor.) I haven't got around to seeing if it would power my hard
drive, but I don't see whyit wouldn't. Good luck.

Source record: 45528
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

What is the keyboard on the Mega STe like? Is it the same as the keyboard on the ST because I personally dislike this keyboard. Too spongy in my honest opinion.

How easy is it to change the keyboard to one that I like should I end up upgrading my 1985 ST (Tos 1.0, single sided drive {originally)) to a Mega2, and the keyboard is the spongy one!?

Just for comparison, at university I am using a Silicon Graphics' Iris Indigo workstation and its keyboard is the best I've ever used. The newer IBM ones are a bit clicky and the SUN keyboards are okay.

-Andrew

P.S.
When is Populous II going to be in the shops for the ST?

Woh, tis a miricle then: I ordered my hard drive from them and it only took 2 weeks on one phone call to them. I must admit the service is not excellent but the hard drive is not bad. I think on of the guys on the complaints desk had to go to the dispatch department and kick some ass to get it sent off.

Now Evasham Micros, this is a good company, very fast turn around from your orders, however the person on the order line does get a bit confused some times (I would like a disk drive for my Atari STFM ---> 1 meg memory up grade), but that was sorted within a week.

The best time however was trying to get TOS1.4 for my machine:

"Sorry out of stock" was the reply from all but Evasham,

"Sorry we have only got the 6 chip set, I put you through to maintance if you which to know the mods for the for board,",

"yes please -- Hello what are the mods for installing a 6 chip set in a two chip set machine,",

"It not hard, but why don't you put in the two chip set"

"It out of stock"

"But I've six sets in front of my here"

"I have one....."

Remeber I have nothing to do with any of the named companies, I am just a customer

Dave J

770. MEGA-LEIF-CONVENTION

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-18 11:54:18 UTC
From: m91der@tdb.uu.se
Message-ID: <1992Feb18.115418.20538@tdb.uu.se>
Source record: 45521

```
--------------------------------------------------
-* Official invitation to the MEGA-LEIF-CONVENTION *-
--------------------------------------------------

This is the official invitation to the enormous and already famous
MEGA-LEIF-CONVENTION. This is an international Atari and PC (other
computers are also welcome) demo-convention held by Electra in
Fyrisskolan/Uppsala/Sweden. It begins at 18:00 (local swedish time)
on Thursday the 16th of April, and lasts until 15:00 on Monday the
20th of April.

In the basement of the school we have an old Physical-activities
hall that'll serve as a silent sleeping room. You'll also find free
showers in the same area. At about 5 minutes walk from the school you'll
find the famous Fyrishov recreation centre, so bring your bathing
clothes! At about 10 minutes walk in another direction you'll find the
centre of Uppsala with resurants, shops and Macdonald's.

There will of course be loads of competitions too, that's the reason
we hired an RGB projector! And what will we do with the RGB projector
before the compos? We`ll show movies and demos on it of course! The
competitions (held by us and TOS Magazine) are:

* best demo (1 Meg STE)
* best picture
* best music (modules and blip-blop)
* othello/reversi tournament (your program will play against the others,
you'll get the exact rules at the party)
* best PC demo

Prices in the different competitions:

* first price in the Atari demo competition will be an Atari TT
* in the PC competition we'll throw 2000 SEK (333 USD) at the winner
* prices in the other competitions will be Quantum harddisks,
a high speed modem, an Amiga, an Atari and a colour monitor.

At the party we'll sell coke and you'll be able to order pizzas
at special reduced prices. You'll also be able to buy other computer-
related items (SIMMs and empty disks for example) on the party

The following Atari crews has already decided to attend:
Electra Omega
The Carebears ULM
The Respectables Electronic Images
Sync TEX
Legacy Mystic
```

The Blackcats Scum of the Earth
Alcoholica Delta Force
Synergy The Lost Boys
Unit 17 EPA
The Syndicate Lazer

PC-Crews: Cascada The Codeblasters
The Space Pigs

This is absolutely not a complete list, we get new answers all
the time. If there are enough good screens we'll compile a party-demo.
Also every good group must bring a lame demo for the ultimate lame
demo. People from outside Sweden can hire a monitor for about 150 SEK
(25 USD). The admission to the convention is 90 SEK (15 USD), for girls
it's free.

How do I get to the convention?
If you come by plane to Arlanda (big airport outside Stockholm) we'll
try to fetch you there. If you arrive at Arlanda at such a bad time
that we can't pick you up you could take bus number 801 to Uppsala
central station or a taxi directly to the school (Fyrisskolan, Uppsala).
Please remember that taxi is VERY expensive in Sweden. If you come by
train you will arrive at Uppsala central station. If you have lots of
luggage we'll try to pick you up. However, if you feel like you could
take a bus then try bus number 9, 12 or 13. They all pass the school.
You could also take a taxi, but it's expensive. If you come by car
please contact us and we will send a map.

Please contact us ASAP and let us know how many monitors you want, if
you want to be fetched and where you want to be fetched.

Call Jesper: int+46 18 463347
or Erik : int+46 18 246777.

Or send a E-mail to: t90_jesper@maja.teknikum.uu.se
or: m91jru@tdb.uu.se

Or ordinary mail to: Jesper Rudberg
Flogstav. 63e
752 63 Uppsala
Sweden

You could also contact me (Daniel Eriksson) on any of the below
mentioned addresses. I'm not a member of Electra, but since there
has been some trouble posting to Usenet from our site lately (due
to bad installation of tin) I posted the above text for Jesper.
If you want to arrange your arrival or reserve a monitor you SHOULD
contact Jesper or Erik.

Daniel Eriksson Internet : m91der@tdb.uu.se
Gardskarsvagen 6B Fidonet : 2:205/218 (The Assembly Room)
814 93 SKUTSKAR IRC : DDF ('Daniel of Delta Force')

>Francoisstrasse 21
>6600 Saarbruecken
>
>Email: roeder@cs.uni-sb.de
> edgar@pingu.saar.sub.org (will change to: .saar.de)

Right: GEMDOS returns LONG negative numbers for errors. BUT: the value
-1 is returned by the BIOS exception handler (which does a normal Pterm()),
so this values is WORD negative (I'm not sure, but the same might apply
for -32).

772. Re: WARNING!!! 3rd Coast Technologies

Newsgroup: comp.sys.atari.st.tech

Source record: 45525

OK, here's my experience of Third Coast...

Last year the power supply of my ST blew up. I rang half a dozen of the biggest
ST dealers in the country, and Third Coast gave me the lowest quote for a new
one. I ordered from them by phone, using a credit card.
Two weeks later, I still had no power supply. I rang again, and was told that
they had no record of my order and that the matter would be investigated.
Another eight days later I sent a very rude letter saying that they could
consider my order cancelled, if indeed they had it.
I received no response to this letter.
In the meantime I ordered a power supply from Evesham Micros, which arrived
after about a week.

There is more to this story; when I saw Third Coast at a computer show last
summer they were selling, for 40 pounds, a power supply identical to one
my dad got in an electronics shop in London for 13 pounds.

It makes me wonder how they stay in business...

Simon Oke.

I have written a program in GFA BASIC. I have another program
which I downloaded from the net called STSPEECH. This program
will speak the contents of a text file. Is there some way that
I can execute the speech program from within my GFA BASIC
program? I tried using the GFA BASIC command EXEC but I couldn't
figure out how to pass the name of the text file to the speech program.
Any suggestions will be appreciated. Please send EMAIL since I
don't read this group as much as I would like to.

Umm... sort of.

I'm in the process of writing a UNIX filesystem for the ST (i-nodes and group permissions on the ST :-) Its going fine. I cant say that I need to though....

The best thing to write is 1) Text output routines. 2) GEM menus.
I've written replacements for both, and now have the ability to have nice smoooth scrolling (like SETUP smooth scrolling on vt100's), multiple fonts WITHOUT Gdos hassle, and custom blinking cursors (I like underline cursors).

I cant say its as good as the OS in all respects though, as it conforms rigidly to a grid layout - one per character. Maybe sometime...

As for menubars, well I have configurable menus, using any combination of 1) pull down (like on Mac). 2) Drop down, 3) Selection without using the buttons(!) [just point, select, and instead of click, just move the arrow off the right of the menu, which selects the current option], auto menu cancel (disappears when mouse moved outside menu),4) selection across whole screen (if not auto cancel, then only the mouse Y coordinate is checked when selecting options, so if menu is at left of screen, then running mouse up and down at far right of the screen still selects options in that menu), 5) Instant menus (like GEM) 6) Scroll-down menus (glide caramel smoothly as if lowered on a piece of paper - really neat!).

Of course these are only available from within my own programs. But maybe I'll work on those text routines and steal TRAP vectors....

>Can someone tell me how sampled sound files are stored such as those
>used by Replay ??? I wish to do some work on them and it would be useful
>to know how the sample is stored.
>

Basically there are two methods of storing sampled data. These are
1) Each byte is signed
2) Each byte is unsigned

I am assuming 8 bit samples here.
With signed samples, the byte value can take the range -128 to 127, (or
-127 to 128, I get confused!).

With unsigned samples, the byte value is just a straight value from 0 -255.
I have a feeling that many samplers will insert a short header before their
saved sample files. For example the I.S.Digitiser, if saving a sequence will
add a series of longword offsets in the sample file for its own uses.

I dont have Replay, but have a look at it with a file editor, or the unix
'HEAD' utility or even SHOW AS TEXT and you should see if there is a header.
The above of course refferres to a saved sample.

Also, dumping the file out as a HEX dump (tinytool or similar) might
prove helpful in determining if the samples are signed or unsigned.

If in doubt, convert your sample files to a known format, and work from
there. EG convert them to signed, and then see if your sampler will still
play them properly. If so, they were signed to start with.
There are various PD tools to do this.

Experiment. It often turns up interesting info.

Hope that helps!

You really don't want to use the operating system calls. Operating systems are for lamers. The only operating system call I ever use is go to supervisor mode. After this, I just rewrite any operating system routines I need - good practice, and the results are usually 10 times better than those using the op system. I've just finished rewriting all the operating system disk functions, and while this took a little work, formatting disks to weird formats is a dead sinch if you access the floppy disk controller directly. I don't know much about op system calls except they're all really shit, but I've read that you can't do much messing with disks using op system calls. You'll need some info to program the FDC directly. The book I used was Atari ST Disk Drives Inside, and Out from Abacus. It's a pretty good book.

777. Need to convert ibm caewalk to notator

>pot across the supply with the sweep to the input and just the pot from
>sweep to ground or 5V. Nothing doing. Anybody else got ideas on this?
>Atari UK have no idea about them!

The Paddle inputs are the same as the old 2600's, beleive it or not.
The proper connection is to connect one of the "ends" of the Pot to VCC
(available on pin 7), and short the other end and the wiper together (to make
a variable resistor) and connect to the paddle input. The pot should be about
1Meg ohms, and linear.

The internal hardware for the Paddle inputs consists of one-shots,
which are reset every 256 "counts" of the 500KHz clock. When the reset is
released, the one-shot timing is controlled by the paddle resistance, and a
680pF capacitor. The formula is:

Pad Value = (1.1) * Rpaddle * 680pF * 500KHz [max value 255]
or
Pad Value = Rpaddle * (350 * 10^-6)

>I've also been playing with the light pen input with limited success.
>I'm using a Honeywell Sweetspot device. This works only vertically.
>Horizontal values just toggle between maximum and minimum.

Could be the response speed of your device. All the internals do is
latch a copy of the vertical and horizontal video counters when the pen input
transitions low [i.e. when the beam passes by the light detector]. Obviously,
the detector must be fast enough to "catch" the beam.

Good Luck!!!!

TRH

779. Fweb ported to the ST (also Re: A bug in Pure C)

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-18 22:27:25 UTC
From: petcher@wuphys.wustl.edu
Message-ID: <1992Feb18.222725.26432@wuphys.wustl.edu>
Source record: 45529

Thanks to those who replied concerning my question about Pure C macro handling. The general consesus is that it is indeed a bug.

Some of you may be interested in knowing that I ran across the problem in trying to port fweb to the ST. I originally tried gcc, but a bug in an earlier version of the ST libraries (apparently there was a bug in malloc) prevented that from working. Although I was finally able to get a working version of ftangle compiled with Pure C, I tried the latest version of gcc this weekend, and the result: a working version of both ftangle and fweave without any changes in the source (except a few cusomizations as necessary for any platform). If anyone is interested in testing in the program and can't compile it themselves (I consider this a beta version) please contact me. The ST should be supported explicitly in the next revison of the sources. The current sources are available by ftp from lyman.pppl.gov (192.55.106.129) for those of you who want to compile yourselves (probably need at least 4Mb and a hard disk). Notes on compiling: the ANSI flag works perfectly with gcc, with the exception that you need to change the file system parameters to reflect the PC-like file system (look in custom.h or custom.web). The only other caveat is that there is no /dev/null file on the ST so you will need a specific file (of your choice) to serve as a dummy file.

For those who do not know what fweb is, it is a derivative of the language, web, by Donald Knuth, in which TeX was written. This language allows you to put source code and TeX commentary in the same file. Passing the web code through the preprocessor fweave produces TeX output to be used as documentation, and passing it through the ftangle preprocessor produces compiler ready source code. Fweb handles fortran, fortran90, C and C++.

Cheers,
Don Petcher petcher@wuphys.wustl.edu

780. Highspeed serial...

Hello, guys...

I just started making a small programm for my ST, sothat it will work as an answer-machine together with the new SupraFaxmodem (i don't have i yet...), and i worked be through the thickest pages of the Inernals of my ST. There i discovered, that the serial port of the ST can be blown up up to 300000 baud (theoretically...), and as i tested it, up to 32000 baud worked very well (i don't have a RTS/CTS modem. I juest pumped data to the serial and checked how long it took.).

So, if anybody is interessted and wants to test this little programm or has other comments to this subject... :-)

Read ya, Phil.

>Edd Deegan
>vatec@uk.ac.pcl.sun

Just to add some more specific info, I have the Replay 8 manual here, there are basically 2 sample formats :
1) Straight .SPL sample, also I believe this is compatible with the Mac .SND format (from a.a.u.e /sound dir I think and the Mac), this is just a straight copy of the sample converted to digital, they are UNSIGNED, with range of 0 to 255. (128 is the zero value, so subtract 128 from all the bytes and you've got signed data). Easy to deal with these samples if you know the playback frequency...

2) 'AVR' format. This is a new format designed it seems to plan for future sampling products etc, it allows for data such as stereo samples, sample names, mucho variations, if anyone is interested I can post the detailed sample format. Of note is that any sample in true 'AVR' format will have '2BIT' as the first four bytes in the file, I have not actually seen this format anywhere yet.

Well I think that's it, if anyone wants the 'AVR' format details just ask...

Ben Gilbert (tymbrimi@u.washington.edu)

Don't you think a DIP64-Chip would be much more interesting, when I see the amount of 260/520/1040/Megas which haven't a PLCC-Chip build in????
I am very interested in a DIP64-68010-16 and I think if the price is fair there would be much more interested users here in Germany. Perhaps you can convice the producer in France of this 'great' interest?

788. Strange Mouse Movements

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-19 06:45:48 UTC
From: remyh@cco.caltech.edu
Message-ID: <1992Feb19.064548.29323@cco.caltech.edu>
Source record: 45539

Why does the ST mouse pointer jump in the opposite direction when the mouse is moved quickly?
What I mean is, normal mouse movement is quite normal (so to speak), however, when I push it with sufficient velocity in one direction, it bounces back in the opposite direction (as though the buffer gets overloaded and it stops the mouse.) I've witnessed this with different mice, and different STs , and I'm curious as to who else has found this. Ultimately, I'd like to know if there is some sort of hard/software fix for this. Does anybody else know what I'm talking about, or am I on heavy drugs?

With many different programs you can't really rely on any particular format for samples. Some trackers load and save sample data as 8-bit signed, whereas others use 8-bit unsigned. A lot of samples I've looked at also have $2cb bytes of $ff at the end for some reason. (It's used by TCB tracker replay routine I think, but I don't know why they didn't bother adding this trailer after loading, and removing it before saving). Then there are STe stereo formats. Your probably best to look at a hex dump of the data and work it out for yourself.

Mbaker@ucs.adelaide.edu.au (Matthew Baker) writes:

-> The cache is write through though so it should have no affect on the application if it is doing self-modifing code.

This is false. The 020 has only an instruction cache, so it isn't write through (Which is only appliable to data caches). Let's suppose you read an instruction at address X. The next instruction modifies X (but X is in the cache), and then the program loops on X. Next time, you will read X from the cache instead of reading the new value in memory. Therefore, you read stale data and the machine crashes.

The only way to handle this is to disable caching. (Don't forget the 020 has an internal Harvard architecture).

Enjoy,

Vincent.

> Read ya, Phil.

The ST RS 232 port can only run at a max of 19.2 bps with is current
state, there is no way to clock it faster, you have to do hardware mods
to make it run faster..

>Interesting. Is there any reason you (or anyone else, for that matter)
>can give for this difference in the ST vs. other 68000 architectures?
>
>Dave Baggett
>dmb@wam.umd.edu
The reason for tihis behavior is really quite simple : the ST video logic accesses the ram with 2MHz, one cycle here is 4 cycles of the processor clock; so the m68 has to wait until it gets access to the ram when it tries to read or write during that phase.

I've always assumed it was because the motion detection is some sort of quadrature detection (think that's the right term), where the timing between the signals seen at the two opto-detectors per axis determine which direction the slotted wheel is moving. If you move too fast, the timing falls in the wrong window, and the detector gets confused and indicates the wrong direction. Think of it as something like why stagecoach wheels turn backwards in western movies :-). I suspect you can't "fix" it.
At least you know you're not on heavier drugs than me! :-)

The Mega STe Keyboard is OK. It is an all new one and not the
Mega ST or ST keyboard.
Since the likes and dislikes are very personal, i would encourage
you to test it in a shop.
I like the keyboard more than the IBM Keyboards, but i never liked
that keyboards much. A lot of the problems are problems with the
layaout and that did not change. (I have problems with the IBM
style layout, when i'm blind typing. There's no best solution)

I don't think so! Most of the Ataris with DIP-processors have
them soldered to the motherboard while NO PLCC-processors
are soldered. To remove a 64-pin chip that is soldered to the
motherboard isn't easy unless you have the right equipment (and
not many have such things).

: I am very interested in a DIP64-68010-16 and I think if the price is fair

The price should be fair, but the problem is that no one seems to
have stocked the 16 MHz DIP and PLCC processors. I don't think
I can convince the factory to take up production. The only way
I see is to get some german magazine (ST Computer/ST Magazin) to
publish an article about the 68010 and the possibilities with it.
That will create a big demand for 16 MHz 68010 and the factory
might take up production for a couple of hours or so.

Source record: 45652
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

You can use the OS calls to create extended format disks without problems, no matter what others may say :-)
I've written my extended formatter & copier using only "Official" calls i.e. those accepted by Atari. Simply call flpformat() (or something like that) with 10 as the number of sectors per track. (And even 80+ as track number) Sure its not as fast as if you had made your own routine, but you are GUARANTEED that it will work on ANY ST, STe or TT.

Everybody is always complaining that Atari makes bad computers which are not all compatible. But if you people had the sense of building your programs only with what is given by Atari, you wouldn't have these problems. and the OS is fast enough even for games. Of course, if you don;t optimize the way you place the calls to GEM, it will be awfully slow, but with some efforts it is possible to create fast, efficient code with TOS & GEM alone.

Its quite common for this to happen, but you really have to move the mouse fast to achieve it. It isn't bad enough to warrant a fix, is it?

It probably is the optical components reaching saturation or something.

Any ideas?

I have an old Apple Hard drive, 40 megabyte i think, and i read in a magazine that it was possible to hook up such a SCSI device to my ST. What i would like to know is; has anyone done such a thing before, if so can they tell me how they did it, indicating possible hardware additions and cost etc. The magazine mentioned a piece of kit called and ICD board (i think??) that acts as an interface between the ST and the drive. I can get my hands on one but i dont know the price!

If anyone can give me some pointers i would be very grateful, it seems a shame to waste a 40 meg hard disk!!

thanks,

Doc

>partition and a limit of 16
>partitions. That would only be 256meg...

MK> This is not correct.
It is too correct.. Tos 1.2 and older have a limit of 16 meg per drive and 126 drive partitions. (And as I forgot and you pointed out the floppies take two so you really only have 224meg available out of the box.)
Tos 1.4 by its self only handles 32meg so it can handle at a maximum 32megx14 which would be 448meg.

MK> Even TOS 1.00 supports partitions bigger than 16 MByte if you're using
MK> a newer (>= 3.02) AHDI.
MK> AHDI simply increases the _logical_ sector size to keep the nuber of
MK> sectors below 32768.
MK> The number of partition is limited by GEMDOS, which currently supports
MK> only 16 logical drives; since the first two are always floppy disks,
MK> there are 14 drives remaining...

>Even using tos 1.4 or newer would only allow you to use a little more..
>16 partitions of 32meg or roughly 512meg..

MK> The maximum size of a single partition is something like 512 MByte or
MK> 1 GByte (I don't know at the moment).
Under normal TOS the limit of 1.4 and newer is 32meg period...

The Atari hard drive utilities which I mentioned (But perhaps didnt say enough about!?) WILL let you get past this because it is a seperate device driver.
Since it is a 16bit fat the only way to go above 16 meg is to expand the size of the clusters as you mentioned. (A cluster is the smallest available size a file can take up.. It is normally 1k in pre tos 1.4 and 2k in 1.4and newer I believe. Thats how you get the 16meg and 32 meg.)
With the AHDI 5.0 you can have drives of size 1gig.. Perhaps its as big as 4gig, not sure. But then you replace or suppliment the normal hard drive support of the Tos version you currently have with the AHDI and all should work fine.
Remember you still have 14 drives available (And this includes any ram drives too...) So you could essentially have 14gig if you had the drives..

BUT if you use the AHDI you loose the original manufacturers hard drive utilities. I am waiting for atari to come out with a 32 or 64bit fat like dos 5 has. With its 32bit fat tables the IBM can have 4gig partitions and they do not have large clusters. I think they use 1k clusters or maybe 2k clusters.

On yea, one last point. With a one gig drive and using it as one partition you are talking of clusters that are quite big. If you figure that a 16 meg partition has a 1k cluster (I am gussing here, its been a while..)
That would be 16384 clusters available with tos. (If the actual size was 2k per sector then figure that 8192 clusters are available.) If you divide that into the size partition you are using you can see how big the clusters are likely to be. With 16384 clusters available a 1gig drive would use aprox 64k per cluster.(At the 8192 available it would be more like 128k per cluster.)
And remember that I said a cluster is the smalles unit the drive can access.. That would mean each dirrectory would take up 64k(128k) and a file that took only two actual bytes on the drive would still take up 64k(128k) and that drive will fill up quick with ALOT of dead space.
Anyone using a disk with partitions over 16meg at this time really needs to either use one big partition for all big files or use as many partitions as they can. I hope atari decides to make a dos 5.0 compatible fat and then the bigger drives will be alot easier to use on the st.

I wrote this message based on information I read in abucus books, the atari dev. docs I have and over 5 years of reading about the ST on the various networks. I would take everything I said to be true unless someone at atari says otherwise.

In closing I will point out again that under OTHER drivers tos 1.2 and older has a limit of 16 meg per partition and tos 1.4 and newer have a limit of 32meg. The AHDI WILL work with ANY of the tos versions (1.0 or newer) and will allow quite large partitions with the only penaltys being that you loose the original drivers that came with your host adapter and you have bigger cluster sizes. (As of this writing I do not believe ANY of the drive manufacturers have drivers built into their software that are com

patible with the atari large partitions. There was another large partition "standard" made by BMS I believe but its different then ataris own.. ICD would let you partition big partitions but you would have to run AHDI to make partitions you could use by AHDI and you cant have more then one driver so you loose the ICD "ICDBOOT.SYS" software support.)

atilghma@sdcc13.ucsd.edu (Adam Tilghman) asks if there's a "lint" for the ST.

The answer is, "modern compilers don't need it, because they do all that type checking if you ask them to." Get GCC (which is free) or Lattice C (which isn't, but is good) or any other ANSI C compiler. Then use prototypes in your program so the compiler can type checking of arguments to functions in other files, the way lint can. Then turn on all warnings (check compiler documentation for how to do this).

I've never heard of a stand-alone lint for the ST.

I don't know how much you know about the ST, but i am now working with this computer for over 4 years know and coded very much, even in assembler, so i think in know very much about this machine.

And as i said: I can't test my programm with a RTS/CTS-modem, because i don't have one. So, perhaps the guy how emailed me can test it and post his experiences. I didn't promise anything, but when you look exactly at the documentation of the usart (the universal synchronous/asynchronous receiver/transmiter) register of the MFP68901, the 8th bit decides if the TC and RC signals are divided by 16 or not. So, i switched this bit off and locked how my serial behaved, and the tests proved that it ran without problems with 28800 (nearly exactly). But as i don't know if there occured any errors, i want someone to test it, so let's wait for it... And perhaps i get my Supramodem within the next few months... :-)

On other thing of interest I've noticed. The high rez replacement
mice trigger this skipping considerably easyier, so I don't think it's
all the mouse sensors fault. Also, if you have a mouse accelerator
installed, the skipping is reduced. Maybe the code that handles the
output of the buffer isn't fast enough, and loses bits, while accelerator
code runs a little more effeciently.

I saw a little program in a German ST magazine that bypasses BIOS parallel
output routines in order to speed up printer output. Me, I did not notice
any difference using it on my TT, but maybe on the ST it could be worth
the little effort to assemble it and put it into the AUTO folder.

I changed it a tiny bit to support the cookie jar.

Here it comes:

I got them from some BBS, which I don't remember the number to... one
catch about them is they're for German keyboards... meaning the postion
of a couple of letters is reversed--not really a loss though.

813. 68010 in a STE?!

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-20 02:28:45 UTC
From: gverrill@engws9.ic.sunysb.edu
Message-ID: <1992Feb20.022845.19698@sbcs.sunysb.edu>
Source record: 45660
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello everyone!

For those of you wondering how to install a 68010 in a STE, how about trying one of the STE installation adapters for the Turbo/16/20/25 from Fast Technologies? This provides simple plug-in installation of a rectangular 68000 into a square STE socket. I don't know if this will work, but it seems fairly straight forward, as long as a 68010 is pin compatible with a standard 68000. If anyone has any luck with this please send me E-mail and let me know how it goes. Good luck!

-Michael Rose

p.s. I am using a friends account!

814. 1040 ST for sale.

FOR SALE :

- Atari 1040 ST

* 1 Megabyte RAM
* 1 Internal Double-Sided 720K drive
* Tos 1.4
* SF314 External DS drive
* SC1224 Color Monitor
* Mouse, mousepad, disk holders, cables, etc.

- This computer comes with all of my disks and games.. I have approximately
100 disks. Among this collection : GFA Basic 3.0, Flight Simulator,
OCP Art Studio, Word Writer, Compute's Second Book of Atari ST,
Interlink 1.85, Masterlink 1.0, Publishing Partner, assorted manuals,
and the book ST Disk Drives Inside & Out.

Asking $400 Or best offer.

Email me if you live out of the dallas/fort worth area. Above does not
include shipping.

Otherwise, if you live in dallas, please call Corey at 214-298-1746, especially
during the hours past 3pm, especially on Tuesdays and Thursdays.

I have a question about FSM GDOS that I can't get answered anywhere.
Can anyone help?

What I want to know is this: Is there, or will there be, a FSM GDOS Font Maker tool available? Perhaps for sale, perhaps for an extra price, perhaps just a utility to convert Calamus/PageStream fonts to FSM GDOS format?

If such a beast is not available, are there plans to market such a thing? I'd love to tinker with some fonts again...

Please reply by e-mail. Thanks in advance.

I think most of the time is spent in the BIOS trap dispatcher, which
is called once for each byte sent.
If there was a BIOS call "send bytes to device ", printer output
would be _much_ faster!
That's yet another TOS design bug... :-(

Hello fellow Netlanders!

I have two problem that I am sure you have the answers for:

1. This must be an FAQ, but I have not been on the for three years in
those days. I have just installed XCONTROL (version 1.0) which I
obtained from atari@terminator.cc.umich.edu. I have a 4 MB 1040 ST
with TOS 1.4. After installation XCONTROL of course was incompatible
with some TSRs. Guess which? Right, Atari's own that were shipped
with TOS 1.4!

When I have MACCEL2 loaded, the mouse pointer freezes after boot and
sometimes bombs out as soon as I move the mouse (or press Alt-Cursor).
Syndrom is addrress error (3 bombs).

When I have TOS14FIX loaded, there are 3 bombs when I open the Modem
CPX.

My question: for which components do I need a newer version and
where can I find it?

2. I have asked this before, but I want to enter special characters
under GEM (more specifically in a dialog box). Characters include
a's, e's and o's with accents. I know GEM can display them, but
how can I enter them from the keyboard? Is there a TSR utility to
do this (eg. with Alt-<KP-digit><KP-digit><KP-digit> as on the
DOS machines?

Regards,
-Roger

This can only be used with Synchronous Comunications, I do sugest you
get a Data Book on the MC68901, as it explains this...

All fast modems don't transfer compressed data files faster than 19/20 kbps,
I have sean a scec on a fast modem, it gave 36k with only text data,
these are v32bis/v42bis modems..

>tries to read or write during that phase.

I was under the impression that the ST's bus ran at 16MHz, so that video and processor access was interleaved (i.e. the processor gets half the cycles and doesn't know that there's anything else on the bus -- same for the video shifter).

If what you say is true, then the processor would stall when writing to the screen, and you'd never be able to DMA onto the screen either. I've never found that to be the case. Does anyone know for sure?

820. Bug in G++ ????

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-20 12:14:40 UTC
From: warwick@cs.uq.oz.au
Message-ID: <6889@uqcspe.cs.uq.oz.au>
Source record: 45669

I doubt this is a bug in the G++ sources, maybe one in the sources, but since
I don't have the resources to build the compiler, perhaps someone who can
could look into these:

First:

```
struct X
{
E(){}
int D(){ return (1 + 8); }
};
```

```
bug.cc: In method int X::D ():

bug.cc:4: numeric constant contains digits beyond the radix

bug.cc:4: parse error at end of input

bug.cc: In method int X::D ():

bug.cc:4: floating constant exponent has no digits

bug.cc:4: parse error at end of input
```

Last, this code reports "parse error at end of input".

```
struct X
{
E(){}
int D(){ return (1 + 8); }
};
```

```

```
From paul@kagaku.se.fujitsu.co.jp Wed Feb 12 21:00:10 1992:

]>>> move d0,d1 d1 = d0 * 1
]>> add d0,d0 d0 = d0 * 2
]>> add d1,d0 d0 = d0 * 2 + d0 * 1 == d0 * 3
]>> add d0,d0 d0 = d0 * 6.
]>
]>What about
]>
]> move d0,d1 d1 = d0
]> lsl #1,d0 d0 = d0 * 2
]> lsl #2,d1 d1 = d1 * 4
]> add d1,d0 d0 = d0 + d1 (= d0 * 2 + d0 * 4 = do * 6)
]>
]>since shifts are faster than adds? (Just to be incredibly pedantic) :)
]
]
]Guy you're a real lamer. If you think shifts are quicker than adds you
]really ought not to be giving other people advice on the net.
]
]Right to clear up this issue once and for all. The first method is
]indeed the quickest - clock cycle break down:
]
] move d0,d1 4 cycles
] add d0,d0 4 cycles
] add d1,d0 4 cycles
] add d0,d0 4 cycles
]
]a total of 16 cycles (Out of an available 8012800 per second on a
]normal ST/STe), whereas your shift method:
]
] move d0,d1 4 cycles
] lsl #1,d0 8 cycles
] lsl #2,d1 12 cycles
] add d1,d0 4 cycles
]
]giving a total of 28 cycles - a bit of a difference.
]
]By the way, in case anybody is going to correct me sayin the shift
]instruction on the 68000 takes 8+2n where n is the shift size, I can
]tell you that although this is the official timings I have read (in
]signetics S68000, and motorola MC68000 manuals) on the ST it is quite
]simply inaccurate. The actual time for shift #n,data-register is:
]
```

] n cycles
] 0 8
] 1 8
] 2 12
] 3 12
] 4 16
] 5 16
] . .
]
]This may seem like a very unimportant detail, but if you are writing
]linear code (say for removing all screen borders using frequency
]flicks) you need complete accuracy for all instructions - the main
]loop must take exactly 160256 cycles, (exactly the time between vbls -
]PAL Televisions), and being out be 2 cycles means the program fucks up.
]
]I'm sick of reading shit like this from lamers.
]PLEASE: IF YOU'RE GOING TO BE PEDANTIC AT LEAST BE CORRECT!
]
]Algo of Digital Destiny (demo crew)
*** end of wuote ***

Listen, pal. I don't know who you are or what your problem is, but I don't need this. Correct me if I say something wrong in a message, but (1) read what I said (as in I said "what about this" as opposed to "you are wrong and my way is the only way"), and (2) JUST correct, don't flame over whether shifts or adds are faster, ok? And (3), in most CPU's in the world, shifts are faster than adds. So sue me for generalizing.

I think it is far more likely that you just don't move the mouse as fast
when you are using an accelerator, since this would _really_ make the
mouse fly. Try it. I can't, since my ST is rather dead at the moment.

Simon.

Source record: 45673

Beware of Gasteiner Technologies Ltd. The standard excuse they use for late delivery is "rain water has gone into their storeroom and damaged the products and that a new batch is being imported". On top that, when their (newly arrived) products fail & you return those and after waiting for more than 3 weeks for a reply you decide to cancel the order and want your money back you must then wait for at least 2 months to get it. Those stupid people never bother to send a written acknowlegement or reply, perhaps trying to save the cost of a letter.

824. Hard Disk Problem

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-20 14:37:29 UTC
From: M.A.Rahin@lut.ac.uk
Message-ID: <1992Feb20.143729.6311@lut.ac.uk>
Source record: 45674

My DIY hard disk unit consists of a Seagate ST277N (embedded SCSI controller, 65 MB, 5-1/4", Half height) and ICD AdSCSI host adapter. The ICD formater version is 5.18 and ICD Hard Disk driver version is 5.5.0. The hard disk formatted ok with interleave factor of 1. I made 5 partitions - 4 for GEM and the other one for Spectre 128. I chose 5 verify passes for scanning for bad sectors and altogether 10 sectors out of 126,790 sectors were found bad. However after making the hard disk to autoboot, I started filling the hard disk and then came across r/w problems (sense codes $11 (mostly), $17 and $18). After copying about 9/10 files to the hard disk (does not matter which partition) the above r/w problems appear. If I try to map out bad sectors using HDUTIL.PRG then I get loads of bad sectors. I tried reformatting the hard disk with various interleave facors (upto 10) but the result is the same, i.e., the hard disk r/w problems appear as I start copying files to the hard disk. The hard disk is presently unusable. Does anyone know what is wrong ? Please reply me through e-mail or post here.

- Rahin

P.S. Does anyone know how to reduce the noise from the hard disk ? My ST277N sounds like a mini turbo engine.

826. Why the mouse will move in the opposite direction when moved QUICKLY

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-20 16:49:03 UTC
From: miskinis@aidev.enet.dec.com
Message-ID: <1992Feb20.215105.16063@ryn.mro4.dec.com>
Source record: 45681

When you move the mouse quickly, you are passing the threshold that is set in the hardware. There are 2 wheels on each axis in the mouse, offset such that when one is blocking the infared path, the other is allowing the infared beam to reah the sensor.

This way the direction that the mouse is moving can be determined. When the mouse is moved faster than the sampling rate of the sensors, the hardware is "fooled" into thinking the direction is reversed.

I BELEIVE THAT THERE IS NO SOFTWARE FIX FOR THIS, and that it is simply a limitation built into the hardware...

John

I don't think the XCONTROL archive at Michigan is the complete package. I
noticed this when I grabbed it a couple of weeks ago. I remember the
original from GEnie (which I lost in a disk crash) as much larger and
including a new, matching version of MACCEL.

(If anybody has MACCEL3, I need a copy.)

> When I have TOS14FIX loaded, there are 3 bombs when I open the Modem
> CPX.

I've been using TOS14FX5 and the modem CPX without problems.

Note that some of the CPXes that are designed to work with the STE
and/or special features of the newer TOSes, such as window colors,
might cause problems on older TOSes.

There are a couple of desk accessories floating around that will let you
enter an alternate character. I believe that TOS 2.x/3.x also lets you
hold down the alt key and type an ASCII value on the numeric keypad.

>>is moved quickly?
>> remyh@cco.caltech.edu
>>

Well, actually... it's due to a bug (or more accurately, a design limitation) in the original controller for the ST's keyboards.

We have created a new controller for the STBook, which solves this problem. The worst the new controller does is _*not keep up*_, but it _always_ goes the correct direction. The point where it starts to drop behind is at a higher speed than where the old unit failed, as well.

This new controller will soon be used in STE's, Mega STE's, etc., as well as any new machines that may come out.

TRH

[The new controller also implements hardware-handshaking in a fully software compatible way; when they start to become available, I will see if I can publish (here) the details of the required modifications to add this feature to your machines, so you can use the new keyboard. They aren't all that large (a few cut-and-jumps, and a couple new parts)]

Form-do-It 1.2d is the best for this I've found. Only problem so far is using it and UIS III under MiNT... But for TOS... It works great.

Once installed (read the docs!!!) it allows you to press the insert key, at which point a box with every character in it appears. Click on the one you want.

Alternatively... I've heard mention of exactly what you're talking about as a patch to the keyboard handler... But I don't use that, I use FormDoIt!

831. .AVR digitized sample format.

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-21 01:11:47 UTC
From: tymbrimi@milton.u.washington.edu
Message-ID: <tymbrimi.698634707@milton>
Source record: 45680

Ok, here's the sample format for the .AVR digitized files, as specified in the Replay 8 manual (from MichTron, cool program). These files are supported by the Replay 8 program and of course anyone else who cares to use them, the sample format was designed to be extensible to new stuff, like MIDI applications, stereo sampling, and 12/16-bit sampling all within the file format (standard .SPL files are 8-bit samples).

```
Byte offset Description
--------------- ------------------------------------------------------
file starts here
----------------
0-3 4-byte ASCII I.D., contains '2BIT', this must be
present if it is to be an .AVR file
4-11 8 byte ASCII character sample name
12-13 Word value --> 0 for mono sample, $FFFF for stereo
14-15 Word --> Sample resolution :
$0008 = 8 bit sample, $0010 = 16 bit
16-17 Word --> $0000 = unsigned sample, $FFFF = signed
18-19 Word --> $0000 = Non-looping sample, $FFFF = looping
(they say other values reserved for other loop types)
20-21 Word --> Assigned MIDI note / Split
$FFFF = No assignment, $FFXX = MIDI note assignment
22-25 Long value --> Sample speed split into 1 byte/3 bytes
byte #22 --> 0 to 7 or $FF
bytes 23-25 --> 3 byte sample frequency, Hertz
26-29 Long --> Length of sample in data bytes or words
30-33 Long --> First loop point (offset in words)
($0000 if unused)
34-37 Long --> End loop point (offset in words)
(If unused, set to sample length)
38-63 Fill with $00, do NOT use, reserved area
64-127 Free area, user-defined, use for whatever extra data
you want
128-EOF Sample data, in format as specified above
```

Ok that's the format, I guess I forgot to say but it's obvious now, all .AVR files have a 128 byte buffer at the start of the file, that is the format I described, of course you must know how to deal with playing the sample and such to use this info, there are some things to watch out for (I can get them out of the manual if anyone needs it, I haven't programmed any sampling except from Gfa BASIC, so maybe ask someone who knows... :-)

Good luck, crank out those digitized effects!

Ben Gilbert

835. 4-Channel Samples on an ordinary ST

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-21 10:01:50 UTC
From: rjwalsh@maths.tcd.ie
Message-ID: <1992Feb21.100150.3388@maths.tcd.ie>
Source record: 45544

How exactly does an ordinary, run-of-the-mill Atari, with no fancy sound chips like the STE has, play 4 samples at the one time (as in Noisetracker and Soundtracker). I tried in vain to disect Noisetracker with MonSt2, but I wasn't very sucessful.. The only thing I can think of is that it plays at 4 times the speed of a sample, playing a bit from sample 1 the first time, from sample 2 the next, and so on. However, I get the impression I'm not right about this, as this would surely slow the machine down quite a bit, and the music should sound very disjointed, so to speak. I've noticed very little slowing down of the machine during playing, and the Sound Tracker blurb says only 28% or so of processor time is used to play everything. It sounds OK too. Does anyone know exactly how the samples are played? Better still, anyone got any sources, or know where to get them?

>prototypes in your program so the compiler can type checking of arguments
>to functions in other files, the way lint can. Then turn on all warnings
>(check compiler documentation for how to do this).
>

Well, there are lint's for DOS which do much more checking than a normal
ANSI compiler. Example: there are ways to check the correct syntax of
calls like printf (and their portability, too). This is outside the scope
of a normal C compiler.

POSIX says in the rationale for not defining a standard for lint:
A C compiler has to understand correct C programs, a lint has to do
meaningful things even with _incorrect_ programs.

>I've never heard of a stand-alone lint for the ST.
>

I really would like to have something similar for TOS...

> about buying a hard drive could do a lot worse than consider Power Computings
> New 900 Series. I bought a 100Mb one about 6 months ago and never had any
> trouble with it.

Power seems to add new improved ranges of HD drives fairly often, but if anyone is considering ordering the 900e, order one with a Quantam mechanism rather than the standard one with the NEC mechanism. My original NEC-mechanism Power Drive was faulty and was replaced. Its replacement was even worse. That went back and I was sent one with a Quantam mechanism; excellent, no problems and very fast.

Maybe I was unlucky with the NEC mechanisms, but I would recommend paying extra for a Quantam mechanism if the option still applies. Posting damaged goods back to Power is expensive, and Power won't pay for the costs. Even worse than the expense is spending hour upon hour reloading files to your HD from floppies and then finding it's *another* faulty drive.

BTW I bear Power no grudge and have done business with them since.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^

It should be possible to intercept the IKBD vector with a bit of code that compares the x and y change with the previous x and y change. If new change is of the opposite sign as the previous change and the absolute difference between the two is greater than a certain value, the routine can deduce that the user could not accelerated the mouse that quickly and the real change is max_change+abs(indicated_change) where max_change is the maxiumum change that can be obtained without this routine.
This would mean you would have to move the mouse twice as fast to get the described effect (which would probably be near-impossible). I don't really the problem is great enough to waste time writting silly routines on though.

The solution is quite simple: try first the run command, the debugger will
stop the program immed with the above message (sig 0), and then set
breakpoints. This is important, because gdb calculates the correct symbol
addresses only after the run command, so you will get garbage when
you set breakpoints before doing run.

-> I bought it in Germany (next door for me :-)). Don't know if it is sold in
-> the US or Canada (they could make money there). It works with TT in all modes
-> (vendor's claim). If it finds another GDOS, it will disable its own.

Well, NVDI runs on the TT. BUT IT HAS MANY BUGS ! (At least the version 2.00 running on my TT). It really sucks in low and medium resolution (The bloc drawing is buggy) ; it works FAIRLY well in high ST rez (Though it has problems with window scrollers).
Maybe the version 2.01 has coped with that bugs.

I never tried NVDI with FSM, memory overflow ! (I have only a 2 Mb TT)

Vincent.

>not many have such things).
>

There is fancy equipment, and there is... not so fancy equipment.

If you are willing to sacrifice the 64pin dip being removed, then
you probably have most of what you need :

a small pair of side cutters
a small tipped soldering iron
a steel barreled pen
a vacum cleaner
duct tape
flux cleaner
static strap
board vise (or equivalent)
good lighting
enough table space
enough patience
steady nerves

For those who see what I am leading to, the procedure done with this
set of tools performs the job much, much better than any commerical
product I've used.

844. Programming and the use of GDOS

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-21 14:53:06 UTC
From: D.M.Johnson@newcastle.ac.uk
Message-ID: <1992Feb21.145306.29482@newcastle.ac.uk>
Source record: 45545

Could some one explain to me the ins and outs of setting up GDOS correctly, I sort of understnad that the assign.sys file must contain the path for the fonts and the that names of the fonts to be used must be placed in list as well under each screen rez. (This was extracted from looking at rthe GEMMII assign.sys file).

Is there a printer.sys file for a deskjet500 and if so how do I go about using it?

Any other useful pieces of information are most welcome

Thank for the help

Dave J.

I tried but failed to get a mail response out on this, so here goes....

Your quotation is bogus. I cannot run GCC and cannot afford Lattice C at home
(I have an Atari 1040ST with 2 DS/DD floppies and have not had too much problem
until this:-). Therefore, instead of answering a serious inquiry you have
wasted bandwidth with useless information vis-a-vis the question "where can
I find a lint utility for the Atari ST line."

>
> Well, there are lint's for DOS which do much more checking than a normal

Hear hear! I second that one. Now, perhaps someone (even me:-) could port
a lint from DOS over to the ST. If someone can drag up the source and get
it to me (preferably by emailing me an ftp address and file location/name),
I'm willing to give it a try....

> >I've never heard of a stand-alone lint for the ST.

You see, this is the biggest waste of all.... First you tell us that the
compiler should do it and then you answer the question by wasting more width
and reader time by saying no, I don't know how to answer your question.
Wonderful....

>
> I really would like to have something similar for TOS...

So would I. I asked for one about 4 months ago and got no useful responses, so
I think someone will need to port one.

Have fun! - Bob

The Mega keyboards are much nicer than the 520 and 1040 ones. I do not
know about the STE's though. One common modification is to by a set of
replacement springs (I cannot remember what they are called, but they are
available from most ST mail order places) for the 520's and 1040's.

850. Software overscanning on STE

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-21 18:18:15 UTC
From: eker@cwi.nl
Message-ID: <5538@charon.cwi.nl>
Source record: 45546

Is there any way of doing software overscan on an STE *without* constantly
toggling the frequency?

The reason I ask is that I saw a French STE demo a while back that
that had almost full horizontal & vertical overscan while doing realtime
bit map magnification & scrolling & music.
- I suppose this could have been achieved by
synching the blitter with the vertical retrace and using
the smudge bit but timing would be awfully tight.

BTW are there any GIF viewers that implement software overscan +
interlace + 4096 colours?

Steven

> I find a lint utility for the Atari ST line."

Allan Pratt's response was helpful. It described the best known method for
ensuring that Atari C code is correct. In the absence of lint, an ANSI
compiler is a reasonable recommendation.

> Now, perhaps someone (even me:-) could port
> a lint from DOS over to the ST. If someone can drag up the source and get
> it to me (preferably by emailing me an ftp address and file location/name),

Read the monthly FAQ posting for comp.lang.c for details about the
(un)availability of source code for lint.

>> >I've never heard of a stand-alone lint for the ST.
>
> You see, this is the biggest waste of all.... First you tell us that the
> compiler should do it and then you answer the question by wasting more width
> and reader time by saying no, I don't know how to answer your question.
> Wonderful....

The flame (like most of the flames in this newsgroup) is unwarranted.
``I've never heard of a stand-alone lint for the ST'' is correct and
carefully worded. The statement ``there is no lint for the ST'' would be
sloppy, since it can't be verified. There's no way to prove that such a
thing doesn't exist.

There's a ``varlint'' program for checking the arguments to printf
functions, but I've not found it to be particularly useful. Source code
was published in comp.sources.atari.st several years ago. See
sources/volume1/varlint from archive-server@twitterpater.eng.sun.com.

No - it adds them together just like in analog audio.

On the subject of fast audio code I saw an article a couple of days ago where some demo writer mentioned using move.b data,(a7)+ in a fast STE routine. The idea being (I presume) to skip over the interleaved stereo samples. (since a7 is the stack pointer, the 68k has to add 2 rather than 1 when incrementing during a byte operation to keep the address even).
It occurred to me that for added speed it might be better to prepare both bytes of stereo data in parallel using say add.w to add two stereo samples simaultaneously - anyone tried this? (Unfortunately I had to leave my STE back in England otherwise I'd try coding this myself)

Must beg to differ .... How helpful is it in my case, please? For many
users, the suggested solution is not a solution at all. Therefore, the flame
in this case is warrented. His response is only helpful if you have 2Mb+ and
a hard disk or can afford > $100 for a C compiler.

BTW, the original poster did not ask for the best known way to check source,
but instead for a lint utility. If Allan Pratt begins by saying, "While
I don't know where to find a lint, if your goal is.... and you have ....
then I do know a solution, it is ...", then I have much less problem. However,
I think a comment like that is better suited to email rather than to News since
it does not directly further the request - where can someone find lint.

> > Now, perhaps someone (even me:-) could port

> thing doesn't exist.

But, you have ignored the fact that the response "I have never heard of a stand-alone lint for the ST" does not progress the discussion. I am sure that there are thousands of users that have never heard of a lint for the ST - do you think it is valuable to use bandwidth for everyone to say "I haven't seen one." Does that make News easier to use? No. Your second statement is valid but does not apply to the comment I made, i.e. the correctness of the statement is not in doubt, only the appropriateness and usefulness.

Source record: 45552

eker@cwi.nl (S.M. Eker) writes:
: Is there any way of doing software overscan on an STE *without* constantly
: toggling the frequency?

Sorry, but that is totally impossible with the lame video-chips
that sits in the ST and STE. There is no way of programming
the resolution :-(

: The reason I ask is that I saw a French STE demo a while back that
: that had almost full horizontal & vertical overscan while doing realtime
: bit map magnification & scrolling & music.

So what? No big deal really. If you want to do something IMPRESSIVE
you do fast filled 3D in full overscan. It's not hard to do the
filled 3D, but to do it fast is VERY hard since you will run into
trouble with the border-code (doing 3D-calculations in full overscan
is REALLY hard if you don't know some nice cheats (and good demo-
programmers do know LOTS of nice cheats)).

: - I suppose this could have been achieved by
: synching the blitter with the vertical retrace and using
: the smudge bit but timing would be awfully tight.

Hmm, I don't think you know how the BLiTTER works on the Atari.
I'm no expert at the BLiTTER, but I can say so much that your
way of doing it impractical AND impossible. Why use the BLiTTER
when you can do it faster with the 68000?

: BTW are there any GIF viewers that implement software overscan +
: interlace + 4096 colours?

Buy yourself an Amiga or a gfx-card!
To be able to emulate 12 bitplanes (4096 colours) you need to
use all processortime to switch colour-palettes. There is no
way (that I know of right now) you can write code that emulates
4096 colours and removes all four borders. To remove the upper
and lower borders are possible since you need so little
processor-time for that. The problem is that you can't remove
the borders (flick between scan-freqs.) and switch colour-
palettes at the same time. You will get visible colour-errors
where the right border used to start.

And you won't be able to fully emulate 12 bitplanes even if
you leave the borders where they are. You CAN'T have 320
different colours per horizontal line since you MUST change
the whole colour-palette (32 bytes) 20 times per scanline.
That makes 640 bytes that needs to be moved into memory

mapped registers in about 320 clock-cycles (to 'draw' one pixel in low resolution takes one clock-cycle for the video-beam, and there are 320 pixels per line). That means you have to move 2 bytes per clock-cycle, and if no one has invented a way of cheating the bus, the memory and the 68000 I must say that it is IMPOSSIBLE.

Please feel free to correct any possible mistakes. It's late now, and a human is only a human. ;-)

> inside.

With the aid of a hacksaw, I was able to get one of these (an original 520) into a standard AT case with a standard AT power supply. Also in the case (and run from the same power supply) are two floppies, one SCSI adapter, a 4M memory upgrade, and a hard drive. I included a hardware delay circuit that gives the hard drive time to power up before applying power to the CPU. Cold and warm reset buttons are wired to the front of the case, but neither affect the power to drive (don't have to re-spin the drive on a cold reset).

The original keyboard is connected through a long cable, but I generally use a DEC LK201 which is attached to the midi port with a VERY long phone cord (this required a small hardware mod). The two keyboards operate in parallel.

> Was worry about the connectors orientation will be hard to access, but the
> suggestion of desolder them and run flat ribbon cable to remount them on the
> back of the case sounds a good way.

It was not necessary for me to unsolder anything. I simply made up ribbon cables with connectors on both ends, plugged them into the mother board connectors, and ran them to the back of the case. This worked for all except the cartridge port, but I am not using that for anything at the moment. For the drives, I also made ribbon cables with connectors on both ends, but these are entirely inside the case.

I have been using this setup for about a year now, with the case on it's side on the floor and just the keyboard and monitor on the desk --quite nice.

>with window scrollers).
> Maybe the version 2.01 has coped with that bugs.

The actual version is 2.02 and there are no bugs in low or medium
resolution. The version 2.00 was published at the ATARI fair in Duessel-
dorf in august 1991, the 2.01 came out in november 91 and since december
there is the 2.02. Perhaps you should better update or send a bugreport to
the distributor (They would tell you that there is already an update...)
than crying out about really old versions...

> I never tried NVDI with FSM, memory overflow ! (I have only a 2 Mb TT)

NVDI works without problems with FSM. Perhaps you installed a FSM-buffer
that was to large for your machine. NVDI only takes about 50 to 70 K
of system memory, depending on the resolution.

I agree about the "spongy" feeling that the Atari keyboard has.

What you could do is buy an interface and use an IBM compatable one.

The *real* IBM one for the PS/2 is really nice... the one that clicks.
I bet it's expensive though.

Craig.

865. File Handles, number of

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-22 14:04:45 UTC
From: mbaker@ucs.adelaide.edu.au
Message-ID: <6336@sirius.ucs.adelaide.edu.au>
Source record: 45561

I'm trying to do some things which necessitate the opening of a large number of files simultaneously. For performance reasons, I can't keep an LRU cache of pseudo-handles and open the one needed on demand.

Experimentation shows that a single process under TOS (GEMDOS, whatever :) is limited to around 17 files open at once, and the system buserrors at around 40 total open by all processes.

Some questions :
1) Is there some way of increasing these numbers?
(possibly substituting for certain internal functions? yecch)

2) Can MiNT handle more than this number? Browsing the MiNT sources, I find that I can't easily determine whether it fully replaces the TOS calls (eg open() and so on) or simply manages calling of them. (In particular, how much of tosfs.c is still in use?)

With respect to MiNT - are there differences between TOS and MiNT domain processes that will enable a MiNT domain process to do this? What _is_ the difference between a MiNT and a TOS domain process anyway? Will the Australians win the cricket again? :)

Any answers will be _very_ greatfully received...

Matt.

From: sourada@iastate.edu
Message-ID: <sourada.698795565@vincent1.iastate.edu>
Source record: 45566

At the moment, due to factors beyond my own control :-), I am stuck with using a T. V. as a monitor. It's not too bad, but the main problem I have is that I can't get my primary T. V. to work with the 50hz output of the ST (required for _some_ programs).

The interesting thing is, another T. V. of mine works fine with the 50Hz output. It is an old (>15yrs!) Quasar... The one that is doesn't work on, though, is my new (<2yrs) portable 14".

Does anyone know a way of folling this one into working correctly with 50hz? I have tried various little attempts that I knew would fail... I don't really know if it's possible, but I'll never know until I ask...

BTW, I'd also like to know why some programs (such as demos) need 50Hz to work. Probably something to do with the timing of the program.

Later,
Steven Ourada

Are you sure your compiler (or more accurately, your compiler's library) isn't the one imposing the "17 open file" limit? I thought that GEMDOS's per-process limit was pretty much the same as the system wide limit. I do know for sure that one program (dviatari) had trouble with MiNT 0.6, which had a 20 file per process limit, but works fine with MiNT 0.9 (which has a 32 file per process limit) and also under TOS, so I would deduce that dviatari opens more than 17 files.

(Most C libraries allow only 20 open streams at a time for I/O; since there are 3 streams (stdin, stdout, and stderr) opened by default, this mean that only 17 fopen() calls could be made successfully, which would explain your result. Using the open() function or the low-level GEMDOS Fopen() function directly should give you the "real" limit on open files.)

> Some questions :
> 1) Is there some way of increasing these numbers?
> (possibly substituting for certain internal functions? yecch)

No. Don't try to do this (seriously)!

> 2) Can MiNT handle more than this number? Browsing the MiNT sources, I find
> that I can't easily determine whether it fully replaces the TOS calls
> (eg open() and so on) or simply manages calling of them.
> (In particular, how much of tosfs.c is still in use?)

MiNT imposes a limit of 32 open files per process. 6 of these are the so-called "standard handles" (like stdin, stdout, etc.), and so there are 26 file handles left for normal use (you could get all 32 by appropriate use of Fforce, if you really have to).

Since MiNT is viewed by GEMDOS as a normal GEMDOS program, you can't have more than N files open on TOS disks at once (where N is the limit imposed by GEMDOS on a single program -- you hypothesize that it's 17 above, but I think it's more like 40). The number of files open on other kinds of disks (e.g. Minix disks, or pipes) is limited only by the amount of memory you have (i.e. if you have 20 processes running, you could in theory have 20x32 = 640 different files open on a Minix disk at once).

> With respect to MiNT - are there differences between TOS and MiNT domain
> processes that will enable a MiNT domain process to do this?
> What _is_ the difference between a MiNT and a TOS domain process anyway?

The only difference between MiNT and TOS domain processes with respect
to opening/closing files is that if you're a MiNT domain process and
you close a standard handle (i.e. one of handles 0-5) it really does
get closed (as under Unix); TOS domain programs automatically re-open
a standard handle to the default for that handle.
In other words:
Fclose(1);
fd = Fcreate("FOO", 0);
redirects the standard output to the file "FOO" if the process is a MiNT
domain one, and fd == 1; if the process is TOS domain (or is running under
"normal" TOS with no MiNT installed) then the standard output is
redirected to the console ("CON:") and fd will be some number >5.

Well, what exactly is the problem you are having? If you have the problem that when you go to 50 Hz, the screen starts flipping and you can't make out a thing, there should be an easy fix. Simple adjust the vertical hold on your TV (I think almost all TV's should have one, on the back usually), this will correct the problem. Of course you will have to adjust it back when you go to 60 Hz but this may be your only fix. Hope this helps!

Oh about your second question why some things work at 50 Hz, it's because in Europe that is the frequency of the power supply, so the TV's and things all work at 50 Hz scan rate I think.

Bye!

>Why does the ST mouse pointer jump in the opposite direction when the mouse
>is moved quickly?

I _THINK_ the reason for this might be as follows (just a guess mind you):
I think mouse movement is calculated as (previous position - final position) * scale factor.. Now, let's say that the rollers on the mouse have 32 different positions (or maybe 36 would be easier - 10 degrees per position). If the first time the mouse is read the x counter is at position 5 and then at position 7, it is assumed you moved it 2 to the right. However, if you move it fast enough, you will go over the semicircumference and a large movement in one direction will be interpreted as a smaller movement in the opposite direction. Eg. first position 5, you move it FAST right and it wraps around to 2.. Now, it SHOULD have been interpreted (32-5)+2=29 to the right, but instead is seen as 2-5=-3 or 3 to the left.. If this is wrong, please correct, but it seems to be a 'working model' for now.. Of course, that's what Thompson said about his model of the atom.. (or was that Thomson?)..

A simpler, better test would be two STs with null modem between them. You would probably find the transferred data to be garbled at regular intervals.

>his experiences. I didn't promise anything, but when you look exactly at
>the documentation of the usart (the universal synchronous/asynchronous

>occured any errors, i want someone to test it, so let's wait for it... And
>perhaps i get my Supramodem within the next few months... :-)

I tried this already, hacked up Zmodem source to run at 38.4k, as well as 61k and 300k. On one end, my Mega 4 with Turbo16. On the other, my STe with AdspeedSTe. The connection was recognizable, but useless for filetransfer or even for interactive terminal use, because at some interval several bytes would get garbled. (Actually, dropping Zmodem packet size down to about 64 bytes I was able to avoid the garble problem, but packet processing overhead made the whole process much slower than plain ol' 9600.) The problem, as Richard mentions in another article, is that the no-divide mode is intended for synchronous serial operation, which means you must have an external clock signal accompanying your data bits. Otherwise the chip simply falls out of sync and garbles those data bits... (*)

There's also a slight problem in that there aren't a whole lot of useful data rates you can configure other than 38.4k. Fast modems support 38.4k and 57.6k DTE rates, you might be able to run 38.4 but there's no way to configure the ST for 57.6k, so you can never get the maximum thruput out of a nice new high speed modem (V.32bis/V.42bis). You also cannot get 64k, which means you cannot take advantage of ISDN. Kind of a drag. But if you have a pair of STs to connect, you can match speeds, I guess.

(*) The other possibility which occurs to me is that one of the other regular system interrupts is interfering with the RS232 interrupt handler. One possible solution which I have yet to try is to write a new RS232 routine that is polled rather than interrupt driven. Maybe by selectively

disabling one or more other interrupts (200hz is the only one I can think
of, tho, and that would be bad) the RS232 port could be serviced in time...

I've received quite a few responses through e-mail as well and wish to thank every one for their help. I am also sorry that I did not include some details of my machine configuration which might have complicated the understanding of my problems.

I have a 520 STFM upgraded to a 1040STFM (i.e., 1MB memory & DSDD floppy) with TOS 1.0. I've in the past, for a short time used a Triangle (a UK brand) hard disk with no problems. This Triangle hard disk uses a proprietary host adapter (ACSI to ST506 converter). My hard disk Seagte ST277N is properly terminated and as far as I can tell the parity is set to off. The disk rotates at around the recommended speed (measeured at 3625 rpm with cache off & 80,000 rpm with cache on). Some of the responders thought that I have a STe and suggested that I should check the DMA chip. Since I have a 520 STFM, is it possible that a faulty DMA chip in it will result similar symptoms ? I am going to borrow my friend's Mega ST and test the hard disk with it. Is it also true that the magnetic coating on the platters of Seagate drives is not very reliable ?

>don't really know if it's possible, but I'll never know until I ask...

I had a similar problem once with a PAL (as opposed to NTSC) TV. It
displayed 50 Hz screens, but couldn't handle 60 Hz. No wonder, because
in Sweden (where I live) and in many other European countries the
television frame rate is 50 Hz. But still there are European TVs that
can handle both 50 and 60 Hz.

I opened the TV, adjusted it to allow a wider range of frequencies
for vertical synchronisation, and then (voila!) any frame rate worked
fine. If you don't feel like doing it yourself I'm sure you can find
a TV retailer/repairman to fix it. I've even seen a TV set with an
external knob for adjusting this.

>BTW, I'd also like to know why some programs (such as demos) need 50Hz to
>work. Probably something to do with the timing of the program.

Spectrum 512 slideshows have to run in 60Hz mode. I guess that's
the opposite problem.

I'm trying to teach myself how to program in C, and have a couple
of rather basic questions relating to gcc.

First of all, is there a way around having to type '\r\n' instead
of '\n'? (A macro perhaps?)

Second, what files do I have to include before I can use gem/tos
calls? (I.e. before I can do something like status = Bconstat(2).)

TOS 1.4 and newer use EXACTLY the same sector/cluster size as 1.0 & 1.2

The reason TOS 1.4 and newer can support 32meg partitions is because they
fixed a sign-extension bug that was in TOS 1.0 & 1.2. In TOS 1.0 & 1.2 the
sector number was treated as a signed number -32K..+32K so you were limited
to 32K sectors (16K clusters). In TOS 1.4 this was changed to an unsigned
number 0..+64K thus extending the range up to 64K sectors (32K clusters).

877. Mac compatibility 030 SST

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-24 03:36:43 UTC
From: carter@cae.wisc.edu
Message-ID: <1992Feb23.213643.21024@doug.cae.wisc.edu>
Source record: 45579

Since the SST's are starting to hit everyone right about now, would anyone like to speculate how effective it might be in writing complete machine addressing descriptions about the ST and creating a complete Mac memory addressing scheme for COMPLETE mac hardware addressing compatbility using the 030's onboard MMU?

I would think such a setup would be possible. I have heard of rumors that DAVE also has IN THE WORKS, the ability to use just such a descriptor address map to switch between ST MODE and MAC MODE on the FLY, or even multitask both the ST/Mac machines at once!

My intuition says YES...what does everyone else think?

-Greg

PS: Having to of my favorite machines, the ST and Mac running at the same time is almost too good to be true....especially with a 40-50Mhz 030 plugged in.....sorry passed out for a second..:).

For one thing there are no Real 38.4 modems, there is a way to compress
TEXT data to give about 36kps by using a V32 bis modem and V42 bis compresion,
I read some good info in a UK, magazine a few mouths back, they fully
tested some H.S. modems, the fastest one was a Codex, it gave 36k with
text data and some 19k with a Ziped File..

Note: These modems only have a line speed of 14.4 kps and some of the
speed is lost with the V42 bis overhead..

You have to change the Hardware clock inputs to get faster data rate
on the Atari...

```
plate@cdsmn.mn.org (Doug Plate) writes:
:
: In the book "ST Internals", it states that the cartridge port is read only
: and that a write to it will cause a bus error. If this is true, how can
: the sound digitizer I have (Replay) input and output through this port?
:
:
: --
: (*)(*)(*)(*)(*)(*)(*)(*)(*)(*)(*)(*)(*)(*)(*)(*)(*)(*)(*)(*)(*)(*)(*)(*)(*)
: Regards,
: Doug Plate
: plate@cdsmn.mn.org

The ST has 4 memory control lines ROM Select 1, 2, 3, 4.

ROM Select 3 0xFA0000 - 0xFAFFFF
ROM Select 4 0xFB0000 - 0xFBFFFF

(or is it the other way round!).

The Cartridge Port is in memory mapped I/O addresses 0xFA0000 - 0xFBFFFF,
and these ROM Select + address bus + data bus are pins on the Cartridge
Port. Thus when you perform a read operation external logic (such as the
Replay Module) can detect it using the address lines.

-Enjoy
Ian.

I've never tried overscan myself - are the interupt timers accurate enough to sync the frequency flicks with the video beam or its it a matter of splitting your code in to linear slices and/or casscades so that exactly the right number of clock cycles are used between frequency flicks?

BTW are there any really impressive overscan demos you could recommend?

> is REALLY hard if you don't know some nice cheats (and good demo-
> programmers do know LOTS of nice cheats)).

Maybe demo programmers would like to share their cheats with comp.sys.atari.st.tech readers...

> Hmm, I don't think you know how the BLiTTER works on the Atari.
> I'm no expert at the BLiTTER, but I can say so much that your
> way of doing it impractical AND impossible. Why use the BLiTTER
> when you can do it faster with the 68000?

I don't have my STE or manuals with me to be certain but I think the blitter would win for scaling factors of >2 - although it can only process four bits of source data per read (only 2^4 half tone regs) it does't have to waste cycles reading machine instructions like the 68000 - Although if you have any code that beats the blitter at 1->4 scaling I'd like to see it.

BTW the blitter seems to be rather under used on the STE (compared with the mileage Amiga coders get out of theirs). This strikes me as odd since the STE blitter should be faster at filled polygons because it doesn't have to read the background except at the ends of each scan line (with a read-modify-write cycle). Of course its crap at doing BLOBs because it any has one source reg...

> Buy yourself an Amiga or a gfx-card!

> way (that I know of right now) you can write code that emulates
:
:
> invented a way of cheating the bus, the memory and the
> 68000 I must say that it is IMPOSSIBLE.

A simple calculation shows that neither Amiga or STE has the memory->video bandwidth for true 12 bit colour - They both have about the bandwidth for 8 bit planes - on the STE this is split with 4 bit planes worth of bandwidth actually used for video & the rest going to the 68000. I believe the Amiga can get a 6-2 split with HAM & Halfbrite modes. (Actually these ratios aen't quite right because video requires no memory access during horizontal & vertical retrace)

Actually, all I had in mind was to have up to 4096 colours on screen at once with the restriction of 16 colours per scan line.
Combined with full overscan + interlace plus some fancy dithering & quantising algorithms that took the 16 colours/scan line restriction into account it should be possible to have quite a reasonable GIF viewer - especially if you throw in hardware panning for large GIFs. Maybe one of those demo coding geniuses out in net-land would like to pick up the challenge...

Steven

>file).

This is correct, and you just do the same for every output device -- screens and printers are all just devices to GEM.

>Is there a printer.sys file for a deskjet500 and if so how do I go about using
>it?

You can get a DeskJet 500 driver from Working Title, UK distributors of Calligrapher. It's free, but it's not Public Domain. (The disk also contains DJ+ and Canon bubble-jet drivers) Just give them a call.

You simply put a line in your ASSIGN.SYS file like this:

21 DESKJET5.SYS

(Substitute the name of the printer driver for DESKJET5.SYS). Follow this line with all the fonts that you have for the Deskjet at 300dpi (any 300 dpi laser fonts will do).

It's true -- you get a bus error if you attempt a write.

You can "fake" a write by reading a memory location and placing the data to be written in the low(?) byte of the address. The address decoder on the cartridge spots the read to this "special" address and latches the low byte of the address into the D to A converter.

Sorry this is a little vague, but I don't have the precise details in front of me.

>the opposite problem.

Actually it's exactly the same problem. The demos involved and Spectrum
512 all get extra colours with heavily timing dependent routines. They
have to change colours in exact synch with the refresh of the TV or
monitor. If you have a 50Hz TV and the program thinks you have a 60Hz
then the screen either flickers out of synch or the colours look
wrong or vanish.

This has always been my main niggle with DMJGif. It's never had a little
toggle so it can run at 50Hz, so I can't peek at the picture until it's
finished. Major pain.

So, if you're out there Mr Jones (it is Jones, isn't it?) can we
EuroUsers have a 50Hz mode please?

Thank you for your attention...

From: m91der@tdb.uu.se
Message-ID: <1992Feb24.200155.3458@tdb.uu.se>
Source record: 45392

eker@cwi.nl (S.M. Eker) writes:
:[stuff deleted]
: I've never tried overscan myself - are the interupt timers accurate enough
: to sync the frequency flicks with the video beam or its it a matter of
: splitting your code in to linear slices and/or casscades so that
: exactly the right number of clock cycles are used between frequency flicks?

No, the interrupts aren't exact enough. And as far as I know the
68000 ALWAYS finish execution of the current instruction before
jumping through the interrupt-vectors. Just think what happens
when a MUL(S) or DIV(S) is executed.

: BTW are there any really impressive overscan demos you could recommend?

Sorry, but I don't recommend overscan demos. You could have a
look at Dark Side Of The Spoon, but that won't work on MSTE.
I've done some overscan-screens in the future, but I won't
do any more.

: I don't have my STE or manuals with me to be certain but I think the blitter
: would win for scaling factors of >2 - although it can only process four bits
: of source data per read (only 2^4 half tone regs) it does't have to waste
: cycles reading machine instructions like the 68000 - Although if you
: have any code that beats the blitter at 1->4 scaling I'd like to see it.

As I said: I'm no expert at the BLiTTER and I've got no code
that I want to share.

: BTW the blitter seems to be rather under used on the STE (compared
: with the mileage Amiga coders get out of theirs). This strikes me as odd
: since the STE blitter should be faster at filled polygons because it
: doesn't have to read the background except at the ends of each scan line
: (with a read-modify-write cycle). Of course its crap at doing BLOBs because
: it any has one source reg...

The Atari-BLiTTER is not very good at anything compared to
the AMiga-BLiTTER with some exceptions (the bitplane-offset
in the Atari is quite nice, and I don't think the Amiga has
that).

: Actually, all I had in mind was to have up to 4096 colours on screen at once
: with the restriction of 16 colours per scan line.

That's possible to code! You could even have more than 16 colours
per line. 32 without big problems.

: Combined with full overscan + interlace plus some fancy dithering &
: quantising algorithms that took the 16 colours/scan line restriction
: into account it should be possible to have quite a reasonable GIF viewer -
: especially if you throw in hardware panning for large GIFs. Maybe one of
: those demo coding geniuses out in net-land would like to pick up the
: challenge...

Hopefully someone will do it, but full overscan is becoming
less popular since it's hard to get it to work on all
computers.

There is a version being made for the MEGASTE/STE computers I do believe.

However, your gonna have to ditch the MEga STE's case, 1040STE's as well, as there isn't enough roon for the proposed upgrade.

Kinda sad, I like the way my MEGA STE looks..

You cunt! I'm the demo coder in question, and that was exactly the
idea! I got STe mod-play down to 15.5% processor time (demo coders
usually say 15.5% of the vbl!) for 12.5kHz replay.

>It occurred to me that for added speed it might be better to prepare both
>bytes of stereo data in parallel using say add.w to add two stereo samples
>simaultaneously - anyone tried this? ...

When I was at re-write 15 or so of the replay routine (!!) I considered
something like this. It would be quite easy to get a 2*stereo sample
mod-player going, with such a method, but I couldn't think of any way to
use add.w to process two pairs of mono samples simultaneously and
consequently speed up the routine further. It's quite unlikely that it's
possible to get normal 4*mono mod replay any faster than 15.5% but you
never know... Anyway, since everyone now knows the a7 trick, why not post
any further ideas here? Maybe we can make STe mod-play as effortless as
it is on the Amiga.

Let me assure you, from having seen it do its thing "in the flesh", it WAILS.
In the words of Dave himself (and this is only a slight exaggeration):

"It'll make yer ears bleed!"

If you would like some cold, hard numbers, someone recently posted an extensive timing chart concerning this. Most of the CPU-intensive stuff was in the range of 1000%. That's right, ten times.

I personally watched Mark Booth (one of Dave's associates) at the Glendale show last Sept. put it through its paces. One of his favorite things was to start up Avant-Vektor on a normal vs. SST setup, and simultaneously start each vector-tracing this intricate bitmap of a pair of theater tickets. He traced them on the SST about 8 times in the time it took the normal to do it once. It's *quite* impressive.

>the samples are played? Better still, anyone got any sources, or know where to
>get them?

I don't think you can mix 4 independent digital audio data patterns
by giving each "channel" every fourth time slice. Even replay of 4
different sinewaves (and they're supposed to have a very "smooth"
sound) would sound terrible.

The solution is to prepare output of a sample by adding the 4 data
words together and make them fit into the digital output word length
using division.

I think the standard ST allows replay of 6-bit samples. If this is
true, then a 4-channel system has to use 4-bit samples. (Since the sum
of four 5-bit samples will exceed the 6-bit total.)

The program algorithm goes like this, I hope you understand my use
of pseudo-code. We assume that each buffer with sampled data uses
8-bit words, to make it more like real life:

```
%main loop:
%get word from channel 0 data buffer
%get word from channel 1 data buffer
%get word from channel 2 data buffer
%get word from channel 3 data buffer
%add words together
%divide by 16 to make sum fit into 6-bit output
%use 6-bit result for digital output
%wait for some kind of synchronisation, determines sample speed
%goto main loop
```

My assumptions regarding maximum size of samples and common sample
word length in the ST may be wrong, but I still think this is how
it could be implemented.

Steven

GIF files are restricted to only 256 colors, so whats the need for a GIF-viewer that can display 4096 color at once ? :-)
And another thing, a truly GOOD GIF-viewer must be able to display 256 colors per scan line, 16 just isn't enough.

>in this case is warrented. His response is only helpful if you have 2Mb+ and
>a hard disk or can afford > $100 for a C compiler.

Calm down... The question is/was the availability of Lint.
The question was not of if the available problem can be run
a minimal ST. If someone sent you the source to lint (unlikly),
would you then be able to compile it and then use it?

I think not. A. Pratt's response *was* helpful. He answerd the query
as posted.

If you intend to use the ST for *serious* work, it would be helpfule
to upgrade your machine (ie memory and/or disk). By the way
the Gnu C compiler cost's way less than $100 (like about $100 less,
it's a freebie

I believe that the problem has to do more with you'r (non-personal you)
inability to use the solution rather than the lack of help offered.
>
>BTW, the original poster did not ask for the best known way to check source,

>so

I think you didn't read my message very carefully.

I simply said that all TOS versions support BIG partitions if a harddisk driver newer than AHDI version 3.01 is used.

There is _no_ (reasonable) limit to the partition size in /any/ TOS version, _but_ a limit to the maximum number of logical sectors per partition (something around 32767 sectors).
(BTW: even TOS 1.04 is reported to contain a bug in the buffer managment that can cause problems in certain rare circumstances if more than 32767 sectors are used!)

If you simply increase the "logical sector" size (by combining two or more "physical" 512-byte-sectors into one logical sector), you can have partitions of almost any size (well, almost - the maximum sector size seems to be 32 KByte).

AHDI 3.02 (and newer) do just this.
AHDI/HDX 5.0 may have other advantages, but it's not strictly necessary to use this newer version.

>Under normal TOS the limit of 1.4 and newer is 32meg period...
>The Atari hard drive utilities which I mentioned (But perhaps didnt say
>enough
>about!?) WILL let you get past this because it is a seperate device driver.

What's that - "normal TOS"?
Whenever you add a hard drive, you /have/ to use a seperate device driver - I've yet to see a TOS version with built-in harddisk driver!

>"standard" made by BMS I believe but its different then ataris own.. ICD
>would

>let you partition big partitions but you would have to run AHDI to make
>partitions you could use by AHDI and you cant have more then one driver so
>you
>loose the ICD "ICDBOOT.SYS" software support.)

The current version of ICD's software (5.something) supports Atari's
BGM and XGM partition schemes (not too surprising - they both are
several years old!)

Simply format a drive using Atari's HDX and then install the ICD driver
on top of it...

I have the following Abacus ST Books for sale:

Atari ST Internals ISBN 0-916439-46-1
Atari ST Machine Language ISBN 0-916439-48-8
Atari ST GEM Programmer's Reference ISBN 0-916439-52-6

The price is set at $24.00 plus COD shipping for all three.
Please follow-up via E-mail since I do not follow usenet regularly.
Thanks!

Jim Bernatowicz

>reason to consider upgrading to the latest TOS version!

You seem to know more about this feature, so maybe you can answer a
question that I asked some time ago (without much success):

Is there a way to turn this feature off to restore compatibility with
previous TOS versions? Some programs have used ALT-keypad before
for other purposes, which was never forbidden. For example, it is
very frustrating to use a terminal emulator that implements VT100
function keys via ALT-keypad under TOS x.06.

Are you sure about this? DMJGif3 peeks alright at 50Hz; the thing I think
that's stupid is that the SPC3375 viewer doesn't flip Hz rates; I have to do
that manually. Grr... Anyhow, my PC (SuperVGA monitor) is due to arrive RSN, so
I'll be using it to view all my Gifs of Cindy Crawford from now on... :-)

The problem is of course that the two samples will need to be played back at
different frequencies (else you could add them together at compile time)
and thus you can't arrange for the next byte of both samples to lie
in locations consective to their respective previous bytes.

|> never know... Anyway, since everyone now knows the a7 trick, why not post
|> any further ideas here? Maybe we can make STe mod-play as effortless as
|> it is on the Amiga.

It's always suprises me how jealous demo coders are of their tricks & hacks -
it seems contrary to the hacker tradition of freedom of infomation and means
that everyone who wants to push their machine to the limits has to reinvent
the wheel... (and some of them rounder than others :-)

I think it would be a good idea if sound & video code was distributed
via this group so that it could be prgressively refined and everyone
could use the fastest
sample / sprite /parallax etc routines. (After all demos aren't commercial.)

This is usually connected with the software overscan nonsense which is almost exclusively used in demos. They toggle the screen frequency at critical times during the screen scanning to force display enable on. This only works for 50Hz native displays and then only on some STs because of chip differences.

I'm quite pleased to see some commercial games that allow you to select the screen frequency (usually by pressing a function key) but they should start up accepting the default frequency of the machine.

Reply-To: harry@issun1.kfk.de
Organization: Kernforschungszentrum Karlsruhe
Subject: Trouble with Signum!2 & HP DeskJet
Keywords:

Hi everybody,

a friend of mine has fixed a HP DeskJet 500 to his 1040ST and now has problems with
Signum!2.

1. If the printer has just been switched on, it isn't responding to printing requests. When
I pulled out the parallel cable and plugged it in again while the ST was hanging, it
started to print. Are there known problems in the timing of the Centronics interface
between a ST and a DeskJet?

2. After printing the first page of a multipage document, the printer just ejects empty
pages, looks like doing formfeeds for eternity.

For detail: He is using Signum!2 V2.01 and the PR30L V2.02.

Perhaps my friend has some hardware problems with the parallel port..., I don't know.

So, if you have or have had (and solved) similiar problems with the same hardware
configuration,
please answer. And if you use the same hardware without any problems, I am also interested
to know this.

Please email answers to me, because usually I am not reading this newsgroup.

Thanks in advance

Harald

>

Chances are that the vertical control will not have the range required to
lock in the 50hz signal. One of the changes that TV designer's have
experienced is the ever increasing quality of incoming signals
(all cynics may 'harrummmppp!' at this point) however, it is true.
In the olden days , when people used rabbit ears, signals were more apt to
vary and TV's had to be able to lock on the widest range practical.
Some of the old TV's will even lock onto the suppressed-sync type of
scrambled pay TV signals.

Todays signals are *very* accurately controlled (at least a the source)
and therefore allow modern TV's to use chip sets and finely tuned circuits
which provide among other things, a much lower cost in terms of dollars
and wattage.

909. Oops! FCOPY3 Streamer fails!!!

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-26 17:43:44 UTC
From: richardson@vaxr.sscl.uwo.ca
Message-ID: <1992Feb26.134344.1@vaxr.sscl.uwo.ca>
Source record: 45409

Has anyone ever tried using the hard disk streamer in FCOPY3 (a rather excellent PD formatter)??? I recently tried it out and got some strange and entirely intermittent problems:
1) when restoring the data to the drive the program sometimes wrote to to the drive when the buffer filled and sometimes it didn't!
2) when it DID write the files back to the drive the runnable progs (.PRG, .APP, .TOS etc.) would NOT run...I simply got 2 bombs and back to the desktop! The .INF, .CFG etc. files seemed fine though...weird eh!

Has anyone ever had a similar problem and if so...WHAT DID YOU DO?

Possible help in diagnosing: The ONE time I did get the data to write back to the drive was when I ran FCOPY3 as a PRG and not as an accessory (as I normally do). As stated this only worked ONCE and has not worked since!

Don't get me wrong, I think FCOPY3 is a *GREAT* program, especially the speed with which it formats (about 5 secs. for a previously formatted disk or about half the time of a regular format if the disk is new), but this appears to be a MAJOR glitch! I'm just glad I didn't use it to save all my stuff before reformatting my hard drive...boy would I have been peeved!

Thanks in advance for any help etc.,
JR.

Sorry to hear you had such bad service from them; I had excellent service from them when the power supply on my 3rd coast hard disk drive died the year before last. It died just before christmas and since I was going up to my parents who live near to Wigan I took the hard disk with me.
I had phoned in advance and they said it may take a week or so to fix.

After searching the industrial estates of Wigan I eventually found the place and they found the problem (faulty power supply), replaced it (which included making up a new power cable) and the fan and charged me a quite reasonable 60quid. This all happened on December 24th so I was quite impressed.

Sorry you had such bad luck,

|> to function on my 1040 ste. It will say "initializing...done" and
|> then it just freezes. Any ideas? Should it just start printing
|> the picture on the screen after that?

Yes, but note that the calculation of a picture is a long long process,
Sometimes (with res. of 300 dpi) you'll wait 10,20,30 ... minutes.

At first, try some other pictures, any of them didn't work.
The columbia.ps picture worked fine.

|> -steve <selick@csa.bu.edu>

Did you started gs from the desktop or from a cli?
If you start from a cli you must set some environment variables, see
doc's for this.
If you start from the desktop: gs.ttp and all startup files (gs_init.ps,
gs_fonts.ps ...) must be in the same directory !

Umm, will it work on the original and ancient 1040ST (as in, I've got the Revision A board. We're talking old here)? Case size is not a problem since I've got mine in a tower case.

I don't have the cash for an SST now, but in the future it might be an option.

This is true...

>However, your gonna have to ditch the MEga STE's case, 1040STE's as well,
>as there isn't enough roon for the proposed upgrade.

...this is not. STE (520/1040) users will most likely have to get a PC case, but Mega STE users will not. On the other hand, the Mega STE version won't have all of the features as the SST version that is currently shipping because of size constraints.

916. ST databases

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-27 05:11:34 UTC
From: swanee@megadata.uucp
Message-ID: <1992Feb27.051134.8817@megadata.uucp>
Source record: 45418

Greetings all,
I am currently looking around at databases and would
like to know if anyone out there knows of a good database that I
may be able to get over here downunder. I've been playing around with
Superbase for a while but it is very slow when performing a query on
a reasonable sized database. I've heard 'Phoenix' mentioned but I
know nothing about it, let alone its availability over here.
BTW, I've been trying to do part field matches in Superbase (i.e.
matching a text string with a part of a field) and all it seems to
want to do is match the string to the entire field. This is pretty
useless if you have a 'keywords' field and want a match with only one
keyword from this field. Perhaps I'm just not using it correctly (more
likely). Any clues or advice would be appreciated.
Thanks in advance,

Sla/n go fo/ill,
Risky B.

I think there will:

As ATARI stated the MultiTOS will only work with Ataris having a PMMU.
So the will use the PMMU for memory protection.

(better a coredump of oner process then the wonderfull bombs and loosing all your work)

From memory there was a Pal version of Spectrum 512, ie, 50hz version,
did that not have a 50hz Slide Show...

50/60hz TV's, some TV's divide the line frequency down to get the Frame
frequency, this is a problem as there is no way to change the frame rate,
but I did see once on a circuit of a TV , that one of the IC's had a
switch option for 50/60hz, but this was not connected..

When you do a INSTALL APPLICATION, give the file extension *.zoo and
repeat this operation for the *.arc and *.lzh and after that save the
desktop, the specified program is called for each extension. I use
the same way for my compressed files (tos 2.06).

From: Robert_Irrgang@ka.maus.de
Message-ID: <A659@KA.maus.de>
Source record: 45436

Hallo,

please excuse any mistakes.

I need some help in the programming of the ZILOG SCC 8530 in the TT and Mega STE.

I want to use the LAN-Interface in SDLC-Mode, but I have problems with the init of the SCC for SDLC-Mode. My routines use the poll-mode of the SCC, but I can't send or receive anything.

My low-level-routines are like the AplleTalk LAP-Routines (old version).

Has anyone an idea for this problem?

From: ddv@unix.brighton.ac.uk
Message-ID: <1992Feb27.144945.15715@unix.brighton.ac.uk>
Source record: 45430

I hate to break up this continual cross-rectification of wrong ideas but
if you want to have a big drive with 16 tho or 32 tho sectors you _MUST_
have some to convert a 'one 64K-long sector please' into 'the system wants 128
512K sectors' this means the tos thinks there are a ok number of (big) sectors
- sector sizes are held in 2 bytes so.... hmmm thats 65535 sectors each with
65535 bytes (max) = 4194176 ish Kb = 4095.875001 GIGABYTES
The FAT will _STILL_ take up 65535*16 bits = 131070 bytes = 2 sectors !!!
(each sector is 65535 ish bytes remember) so what is the problem all you need
is a driver to do the conversions internally and send out the siggs to the
device.

Domenico De Vitto
ddv@uk.ac.bton.unix

I think that the above is a near the truth, but don't flame me about
"it's 65536 not 65535" or vs.vs (or anything else) 'cause I don't really care.

Yeah; no one needs to read this kind of crap. Keep your misogynystic
profanity to email please.

>>[Paul's experiences with sample playback deleted]
>
>The problem is of course that the two samples will need to be played back at
>different frequencies (else you could add them together at compile time)
>and thus you can't arrange for the next byte of both samples to lie
>in locations consective to their respective previous bytes.

Bingo. Unless you stretch and shrink the samples ahead of time for all
the possible pitches, you need to have a separate timer for each
voice. The ST does have two available timers (A & D), though
coordinating the two to mix the samples doesn't seem easy; I doubt
you'd get very good sound quality, but it could work. Using timer D
would also cost you your RS-232 timing.

If anyone's written a multi-voice sample playback routine *without*
prescaling the samples, I'd be very interested to hear how it's done.
Otherwise the technique is limited to demos and trackers, not
things like games where you need to devote some RAM to annyoning
trivialities like graphics. :-)

>It's always suprises me how jealous demo coders are of their tricks & hacks -

Agreed.

>I think it would be a good idea if sound & video code was distributed
>via this group so that it could be prgressively refined and everyone
>could use the fastest
>sample / sprite /parallax etc routines. (After all demos aren't commercial.)

With that in mind, I'll mention that you can get assembly code to play
samples (one channel) from atari.archive:atari/sound/players/resound.arc.

gemini works under mint, I tried it, and had no problems at all.
But to get the additional features (i.e. starting programs to background), you have to do some things on your own, for mupfel does not know about mint.

When you install a application with *.zoo and repeat this step, you _must_ delete the text ZOO so that you can type LZH. Now when you do Okay tos will delete the previous installation and install the new one. If you just do a SAVE DESKTOP, the old line for *.zoo will be overwritten.

So I think it is _NOT_ possible to install more than one file extension per application. Try what I said and you will see it.

931. Sozobon 1.33, what happened???

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-28 04:44:29 UTC
From: tymbrimi@milton.u.washington.edu
Message-ID: <tymbrimi.699252269@milton>
Source record: 45435

Help!!! Like I mentioned several weeks ago, I installed Sozobon 1.33 (Heat-n-Serve) on my TOS 1.0 520STFM w/ 2.5 megs, it worked flawlessly for a few weeks, and I have just been learning to program it for VDI and whatnot.

This is the problem : The assembler program is broken!?!? Whenever I try to run the assembler (I usually just run CC.TTP and it runs the assembler, JAS.TTP, for me), the computer gets a bus error (2 bombs) and I get this message from the assembler :
Fatal error <no files open>: couldn't open source files...

(Well that was the general idea, it might have been slightly different.. :)
I have checked through all the environmental variables, they are OK, and I am calling the program right (CC file.c lib.a etc...), but the main weird thing is that it worked perfectly two weeks ago!

Can anyone provide some insight into this problem, I am looking forward to doing some neato GEM programming and I don't want to have to download and un-arc that whole entire thing again.

Thanks!

P.S. I got the new Atari Explore and ST Format from Britain, they both have the STBook pictured, it looks cool... Also they had an interview with a guy from Lexicor (Prism Paint, Chronos, etc) that had some cool ideas in it, not the least of was the mention of the Leonardo card, 24bit true color, WOW!

The real reason has nothing to do with demos toggling the scan bit.
It's the simple fact that the North American TV's don't lock to 50hz
very well. Even some of the 60hz monitors sold by Atari don't lock,
though most can be adjusted to find an accepable compromise between 50
and 60 hz. TV's on the other hand are becoming less adjustable, as the
adjustment is taken over by automatic circuitry, which isn't designed
with the expectation of seeing a 50hz scan frequency. It's nice that
some games allow the toggle, but many UK games companies consider the
NA games market so trivial, they won't even bother making this conc-
ession to the North American market.

I'm using ADIMENS ST Plus for a long time, even for business.
It is not the fastest but if you have less than 5000 sets in a file
it nearly works at real-time (with a good harddisk). ADIMENS is not
supported any more but Application Systems Heidelberg bought the
license and developped with the same developpers from ADIMENS the
new Phoenix Database System. For me it's the best database
momentarily at the market. But if you wait a little longer, there
will be a very fast database called 1stBase which is very new.

Mail, if you have further questions

[..stuff deleted..]

So I think it is _NOT_ possible to install more than one file extension
per application. Try what I said and you will see it.
ap.

Oh yes, it is possible.
Here is the bottom part of my DESKTOP.INF file :

```
#F FF 04 @ *.*@
#D FF 01 @ *.*@
#P 03 04 C:\MINIVIEW.TTP@ *.*@
#G 03 FF *.APP@ @
#G 03 FF *.PRG@ @
#F 03 04 *.TOS@ @
#P 03 04 *.TTP@ @
#P 03 04 G:\PACK\UNARC.TTP@ *.ARC@
#G 03 04 G:\PACK\UNLZH17.PRG@ *.LZH@
#G 03 04 G:\GRAPHICS\GEMVIEW.PRG@ *.PC?@
#G 03 04 G:\GRAPHICS\GEMVIEW.PRG@ *.PI?@
#G 03 04 G:\GRAPHICS\GEMVIEW.PRG@ *.IMG@
#G 03 04 G:\GRAPHICS\GEMVIEW.PRG@ *.GEM@
#G 03 04 G:\GRAPHICS\GEMVIEW.PRG@ *.IFF@
#G 03 04 G:\GRAPHICS\GEMVIEW.PRG@ *.TNY@
#G 03 04 G:\GRAPHICS\GIFFER.TTP@ *.GIF@
#G 03 04 G:\GRAPHICS\GEMVIEW.PRG@ *.SP?@
#P 03 04 G:\GRAPHICS\CONVRT2X.TTP@ *.CVG@
#G 03 04 G:\PACK\DCX_PLUS.PRG@ *.ZOO@
```

Firstly GEMVIEW has been installed with 7 different extensions, and
then I have installed MINIVIEW so that it will start up when files with
unknown extensions are encountered.
When you double-click on a file, the DESKTOP.INF file is read from the
bottom. If the extension isn't found in the bottom line, the previous
line is tested ... and so on.
however, this can't be done from the desktop-menu, you will have to
use a text-editor to edit it.

I don't think coordinating two timers is really practical. Anyway I think you may be confusing sampling frequency with the frequency present within the sample (what I was refering to).

|> If anyone's written a multi-voice sample playback routine *without*

|> things like games where you need to devote some RAM to annyoning
|> trivialities like graphics. :-)

I've never coded a sample playback routine & I don't have my STe with me to try now; but this is how I think you do it...

The basic idea is to play all samples back a fixed frequency (say 12.5KHz) and change the pitch by skipping data.

You first need to have your sample recorded (or interpolated to) a frequency (say 100KHz) much higher than your constant playback frequency. Now if the original pitch was say middle C and you play it back at 12.5KHz you'll be a couple of octaves low. But if you play it back and only use every 4th sample you'll be back at your original pitch. And if you play it back and use every 6th sample you'll increase the pitch by a perfect 5th (in this case G above middle C). The general formula is (assuming an even tempered scale)

$$\text{step_size} = 2^{\frac{(x/12)\ \text{rec_freq}}{\text{play_freq}}}$$

where x is the number of semi-tones you want to raise (-ve to lower) the pitch.

Now you can see why the rec frequency should as large a multiple of the playback
frequency as you can afford the RAM for - it minimises rounding errors and improves pitch accuracy. If you round the step size to an integer you're likely to get substatial errors in pitch - better to scale the step size by a power of 2 and scale the current position in the sample table back when

you actually fetch the sample byte - if you have cpu time to burn you could even
try interpolating adjacent sample bytes using the fractional part of the current position.

Now since all samples will have the same play back frequency (regardless of actual
pitch) you can add them together with out difficulty. On a ST I believe there are only 3 * 16 levels of amplitude available so you will need a look up table to do the convesion. On the STe there are two 8-bit channels available and you can use the DMA to do double buffering - you only have to run an interupt rountine when one the current buffer is empty. The interupt code should switch the DMA reg to the 2nd buffer (which contains fresh data) and refil the old one. In this way you only have to use a small fraction of the CPU time to do sound precessing in the background.

Note that since you are skipping data by different values for each (virtual) channel there it no fancy way (at least that I can think of) to arrange the data in memory so that you can process two consecutive sets of bytes using the 68k's word instructions - this was my original point.

Paul claimed 15.5% vbi for (I think) two mono samples at 12.5KHz. This gives about (96cpu cycles & 24mem cycles) / (computed sample byte) which seems a
little slow for linear code - but perhaps he is doing some fancy processing to keep up the sound quality. By the way if you want to loop samples you should scale your sample so that the loop is a power of 2 to avoid wrap-around checking.

Steven

You can fit any "eurocard" style VME bus Ethernet card to a TT or Mega STE.
You'll have to find a driver for it, and I can't help there -- the people I
know with ethernet cards run Unix SVR4 (sort of a _big_ ethernet driver :-))

At least in good ol' TOS 1.0 and 1.02 it was easy to do! Maybe the
Install menu item does not allow this, but manually editing
DESKTOP.INF worked well enough for me: MG was called on all *.H, *.C,
*.G, and *.INF files.

-> [though they will not always reward you with a free update :-(].

Well, it was not exactly my TT, but the magazine's one. We ran SIM CITY with NVDI, it was really a mess : as the mouse moved through the screen, it left an area of garbage... And it has got some problems with a software called "Le Redacteur", but here I suspect the word processor to be faulty.

I think we reported the bugs in the test article we made.

Ciao.

In article <5598@charon.cwi.nl> eker@cwi.nl (S.M. Eker) writes:
>I don't think coordinating two timers is really practical. Anyway I think you
>may be confusing sampling frequency with the frequency present within
>the sample (what I was refering to).

Hmm? I don't follow this. If you want to play back samples at different pitches you need to scale your samples to all the possible pitches you want to play, either in precalculation or in real-time. You can either FFT them to change the frequency domain directly (very slow without hardware support) or just stretch and shrink them. The latter techqniue also aliases the sound, so you get a different timbre. Hence the "munchkin effect." But it does have the virtue that it can be done very quickly, which is why it's used in most sampling keyboards (if not all) and computer programs.

But the point is that to play four voices simultaneously at four potentially different pitches (like a tracker does) you need to either prescale the samples ahead of time and store them in a big table (possible in a tracker where the only advertised function is to play music but not in a game where you have code and RAM devoted to gameplay and graphics) or scale them in real time by changing the playback frequency.

The reason you can't do the latter is that you don't have four inependent timers on the ST. That means at least some of the samples will have to be played back at the same frequency. Hence you need to do some kind of software scaling.

At least, that's what I meant to say.

>The basic idea is to play all samples back a fixed frequency (say
>12.5KHz) and change the pitch by skipping data.

A friend of mine has dubbed this the "Car Wars" method because it's just like the movement system in the Steve Jackson wargame of the same name.

The problem with the Car Wars method is that you'd have to run your base timer incredibly fast to get accurate timing. As you mentioned in passing, to get the next half step of pitch you multiply frequency by the 12th root of 2. That's not a big number (approx 1.06), so the difference between notes at lower frequencies is very small. (e.g., A = 440Hz, A♯ = 466.4 under on popular tuning system) The Car Wars method is not going to get you accurate differences of 16.4 cycles per second.

> The general formula is (assuming an even tempered scale)
>
> (x/12) rec_freq
>step_size = 2 -------------
> play_freq
>

Yeah, but let's try some real numbers. Asume a base frequency of 250kHz. This is impossibly fast for an 8 MHz ST, but lets assume everyone has Dave Small's 50 MHz SST board for the sake of argument. Look at succesive divisions of two (kHz):

250, 125, 62.5, 31.25, 15.625, 7.8125, 3.90625, 1.953125, .976, .488, .244, .122, .061, .03, .015, .0075

So you see that our A and A♯ would both map to 488Hz, as would most other notes in that octave. In fact, you only have 15 distinct pitches across the whole audio spectrum!

But actually there's a bit more to the Car Wars method as my friend describes iut, and perhaps this is what you were getting at: There's no reason you always have to divide by two, since you're really just skipping a certain number of sample each iteration. So you can divide your main clock by 2, 3, 4, 5 ... with no problem -- it's all addition anyway. This will give you some more accuracy.

You can also skip different amounts each time; e.g., skip 2, then 3, then 2, etc. This might produce an even slowdown when taken across the whole sample.

It seems possible to write a 4-voice sample player using this kind of Car Wars table-driven technique but I'm not sure the results would be that great. That's why I was curious to hear if anyone had tried scaling the samples in real-time like this.

Hi.. I need a program for the ST that will work with a Tape backup drive.
I would like to just get a SCSI tape drive, and backup my HD onto it, freeing
up my SyQuest carts for more important things.

I saw a program for the IBM once that would let you go through the programs
on the tape and selectively retreive things. That would be best case..

If anyone knows of a program.. please drop me some mail.. Thanks..

>
>So I think it is _NOT_ possible to install more than one file extension
>per application. Try what I said and you will see it.
> ap.
It is QUITE possible, as I have been doing it for YEARS on both tos 1.0 and now 1.2... The easiest way to do it is this: install the app for ONE of your extensions ONLY.. Save your desktop.. Then pull up your desktop.inf file in your favourite editor.. Simply copy the line where it contains your app for each extension you need. Then, change the extension for each different one, and resave your desktop.inf.. Voila!
(here's what I mean - let's assume your app is called arc.prg)
desktop.inf looks like:
..... (bunch of stuff)
#03 #04 @arc @arc.prg (just a sample - info is NOT accurate)
you copy it 5 times, and then it looks like:
#03 #04 @arc @c:\path\arc.prg (this lets you run it from a different dir)
#03 #04 @zoo @c:\path\arc.prg
@lzh
@zip

etc... If you still have problems, I can send you my desktop.inf file..
btw, only use c:\path\filename.ext if you're using a hard drive.. If you're only going to be doing this off floppy (I would assume you have an hd), then don't bother with the path and just put the archiver on the root dir..

945. Need help installing GNU C++ (G++)

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-28 18:03:04 UTC
From: cmedley@wam.umd.edu
Message-ID: <1992Feb28.180304.7255@wam.umd.edu>
Source record: 45344

I've been trying (on and off) to try to get the G++ package installed on my Mega ST 2. I've got a 105MB HD, so disk space is no problem, but I only have 2MB of RAM (soon to be 4MB).

My problem is that I'm completely lost (still!) as to the proper environment variables used, and where all the files from each particular archive go. If someone could email me a description of their G++ installation and a listing of the files and directories so I could see how this should go (and to check for omissions in my own), this would be greatly appreciated.

Also, the error that has led me to this point of frustration is that when I do:

g++ average.cc

<average.cc is a simple 1K program to average some integers... no biggie>

I always get:

xfile.o: vfscanf not defined

<there may be some underscores omitted from the vfscanf name...>

Thanks in advance for any help...

From: vjrao@owlnet.rice.edu
Message-ID: <1992Feb29.040032.15597@rice.edu>
Source record: 45352

I just bought a MegaSTE and am experiencing a couple of problems with it:

1) In monochrome mode, faint vertical bars are present on the screen
(especially noticeable at 8mhz).

2) On some sound demos, the sound has static/noise.

3) The right edge of the screen screen shifts over to the left after running
certain picture viewer programs.

I believe some others were also experiencing some of these symptoms on their
machines not too long ago. Does anyone know what could be the cause of any
of these problems? I have returned my first machine for another, and although
less noticeable, this new machine seems to have the same problems as the other
one. It seems there are a lot of MegaSTE's that have these problems and I
wonder if anyone at Atari has anything official to say about this. Thanks in
advance.

i am enclosing my startup file for gulam (gulam.g) that includes everything you need for GCC and G++. note that you do need GCC, too, to run G++. i think u need the cpp and certainly the libraries and probably thus the header (*.h) files. i don't have just g++, so i could not tell you which pieces of GCC are needed. with 105 MB as you claim to have, this should be no problem. when in doubt, get everything u can...

obviously, you will have different directory structure. the really important things are:

PATH for non-gnu executables (dirs)
GNUINC for GCC headers (dirs)
GNULIB for *.olb and startup crt0.o (dir)
GCCEXEC prefix for executables (see below)
GXXINC for G++ headers (dirs)
env_style for extended args (this is usually needed for
> 128 char command lines which gcc.ttp gens)

i think both gcc and g++ also use TEMP (which i set to my 1 MB ramdisk). i use GNU make 3.60 which i hacked up slightly. works fine. needs env_style in gulam. your shell may vary.

also be careful when unpacking the executables. the files MUST be named gcc-*.ttp, and NOT gcc_*.ttp (underscore for dash). zoo may have a problem with these. if u get the underscore, just mv the file(s).

good luck...

From: Roger.Sheppard@bbs.actrix.gen.nz
Message-ID: <1992Feb29.132841.2414@actrix.gen.nz>
Source record: 45354

Some time back there were a few postings on sound a screen problems
with Mega STE's or was it STE's..

If the problem did concern STE's, what are the best programs to show
these faults..

I have just managed to get myself a very cheap STE, at a shop clear out
sale, say $230US for a 520 STE, it looks like I don't have the DMA
hard disk problem, but I would like to know about the DMA sound problems
and the screen problems that I think that I have read about..Thanks...

>> partitions. That would only be 256meg...
R>
MK>> This is not correct.
R> It is too correct.. Tos 1.2 and older have a limit of 16 meg per drive and
R> 126 drive partitions. (And as I forgot and you pointed out the floppies
R> take two so you really only have 224meg available out of the box.)
R> Tos 1.4 by its self only handles 32meg so it can handle at a maximum
R> 32megx14 which would be 448meg.

It is not correct. The difference between 1.02 and 1.04 is the use of an int as opposed to
an unsigned int for the storage of logical sector numbers.

MK>> Even TOS 1.00 supports partitions bigger than 16 MByte if you're using
MK>> a newer (>= 3.02) AHDI.
MK>> AHDI simply increases the _logical_ sector size to keep the nuber of
MK>> sectors below 32768.
MK>> The number of partition is limited by GEMDOS, which currently supports
MK>> only 16 logical drives; since the first two are always floppy disks,
MK>> there are 14 drives remaining...
R>
>> Even using tos 1.4 or newer would only allow you to use a little more..
>> 16 partitions of 32meg or roughly 512meg..

You are ignorant of something _very_ funadmental here...

Not to mention the fact that TOS 1.04+ lets you go all the way up to drive Z:,
giving you 24 partitions...

MK>> The maximum size of a single partition is something like 512 MByte or
MK>> 1 GByte (I don't know at the moment).
```

R> Under normal TOS the limit of 1.4 and newer is 32meg period...
R>
R> The Atari hard drive utilities which I mentioned (But perhaps didnt say
R> enough about!?) WILL let you get past this because it is a seperate device
R> driver. Since it is a 16bit fat the only way to go above 16 meg is to
R> expand the size of the clusters as you mentioned. (A cluster is the
R> smallest available size a file can take up.. It is normally 1k in pre tos
R> 1.4 and 2k in 1.4and newer I believe. Thats how you get the 16meg and 32
R> meg.) With the AHDI 5.0 you can have drives of size 1gig.. Perhaps its as
R> big as 4gig, not sure. But then you replace or suppliment the normal hard
R> drive support of the Tos version you currently have with the AHDI and all
R> should work fine.
R> Remember you still have 14 drives available (And this includes any ram
R> drives too...) So you could essentially have 14gig if you had the
R> drives..
R> BUT if you use the AHDI you loose the original manufacturers hard drive
R> utilities. I am waiting for atari to come out with a 32 or 64bit fat like
R> dos 5 has. With its 32bit fat tables the IBM can have 4gig partitions and
R> they do not have large clusters. I think they use 1k clusters or maybe 2k
R> clusters.

Ah. You don't understand at all. TOS has ___NO___ hard disk support whatsoever. There is no 'inherent hard disk driver' in TOS...
The problem with other manufacturer's drivers not handling BGM partitions is the fault of the 3rd party manufacturer, not the 'limitations' of TOS.
Cluster size should never vary from 2 logical sectors... You are wrong there too, in that there is no 'cluster size in TOS x.xx' - TOS has no say in what the cluster size will be, and will happily handle any reasonable value you give it.

I Reiterate... There _IS_NO_'NORMAL'_HARD_DISK_SUPPORT_ AHDI is the driver for atari drives, if you use an ICD, then you use ICDBOOT, if you use a MAXXON, thenm you use CBHD, etc etc...

R> On yea, one last point. With a one gig drive and using it as one partition
R> you are talking of clusters that are quite big. If you figure that a 16
R> meg partition has a 1k cluster (I am gussing here, its been a while..)

Too bloody right it has.

R> That would be 16384 clusters available with tos. (If the actual size was
R> 2k per sector then figure that 8192 clusters are available.) If you divide
R> that into the size partition you are using you can see how big the
R> clusters are likely to be. With 16384 clusters available a 1gig drive
R> would use aprox 64k per cluster.(At the 8192 available it would be more
R> like 128k per cluster.) And remember that I said a cluster is the smalles
R> unit the drive can access.. That would mean each dirrectory would take up
R> 64k(128k) and a file that took only two actual bytes on the drive would
R> still take up 64k(128k) and that drive will fill up quick with ALOT of
R> dead space. Anyone using a disk with partitions over 16meg at this time
R> really needs to either use one big partition for all big files or use as
R> many partitions as they can. I hope atari decides to make a dos 5.0
R> compatible fat and then the bigger drives will be alot easier to use on

R> the st.

Well, that's the biggest crock I've read in quite a long while!

With TOS 1.00 and 1.02 you have a maximum of 16K clusters. With TOS 1.04+ you have 32K. Messy-DOS 5.00 still uses expanded cluster sizes.

R> I wrote this message based on information I read in abucus books, the
R> atari dev. docs I have and over 5 years of reading about the ST on the
R> various networks. I would take everything I said to be true unless someone
R> at atari says otherwise.

I'd say it was mostly bullshit myself. No offence, you're just _wrong_.

Incidentally, if you're interested in learning something about the subject, try getting your hands on Klaus' book Sheibenkleister II - assuming you can manage German OK.

R> In closing I will point out again that under OTHER drivers tos 1.2 and
R> older has a limit of 16 meg per partition and tos 1.4 and newer have a
R> limit of 32meg. The AHDI WILL work with ANY of the tos versions (1.0 or
R> newer) and will allow quite large partitions with the only penaltys being
R> that you loose the original drivers that came with your host adapter and
R> you have bigger cluster sizes. (As of this writing I do not believe ANY of
R> the drive manufacturers have drivers built into their software that are
R> compatible with the atari large partitions. There was another large
R> partition
R> "standard" made by BMS I believe but its different then ataris own.. ICD
R> would let you partition big partitions but you would have to run AHDI to
R> make partitions you could use by AHDI and you cant have more then one
R> driver so you loose the ICD "ICDBOOT.SYS" software support.)

That about the ICD drivers is rubbish as well. Do you have an ICD adapter? Have you ever bothered to upgrade your software? for a _long_ time now they have supported the BGM partition format, not to mention the extended partitioning scheme that lets you have 12 partitions per drive, rather than 4.

951. 1040ST bus timing questions

Newsgroup: comp.sys.atari.st.tech
Date: 1992-02-29 23:20:17 UTC
From: bwhite@bigbird.cs.ohiou.edu
Message-ID: <5044@oucsace.cs.OHIOU.EDU>
Source record: 45355

I have a few questions about the 1040ST bus timing, relating to a piece of hardware I'm designing (and may actually have the money to make someday :-)) This all pertains to the lines available at the cartridge port.

1) I assume that the address information is valid before and after the read is performed (i.e., address is valid before data must be valid, and is valid after data may change). Graphically, ...

```
_____________________________
SELECT _______//// \\\\_______________
_______________
DATA ____________///// \\\\\_____________________
```

where SELECT is the UDS / LDS and the appropriate ROMx output, and DATA just shows where it's valid.

1a) How long is address information guaranteed to be fixed?
1b) How long after address information is valid until the data must be valid?
1c) How long must data information be valid?

2) If the LDS (or UDS) line goes active (low), may data be placed on the cartridge port bus even if ROM3 and ROM4 are both inactive (high), or must one of them be active as well?

3) If the 68000 accesses the cartridge port memory in byte-only move mode (used for memory-mapped I/O), does only one of {UDS, LDS} go active (low)? Or do they both go low anyway?

Thank you for your time.

Source record: 45292

RF> * Original From: michael smith (3:680/842)
RF> * Original To : Rod.Fulk@f24.n228.z1.FidoNet.Org (1:228/24)

I was not aware that TOS 1.04 got the 32meg by just changing the int it used..
But still.. Without using the new atari HDX you can not get bigger then 16meg on 1.0, 1.02 and any other version before 1.04. 1.04 allows for 32meg without going to a "big" partition format.

Logical sector size and Clusters are the same thing...
The HD driver decides what size this is.
(Tos does TOO have HD support even if it IS limited. You can boot a drive
and get access to drive C without any special drivers as long as it is strickly compatible with the Atari driver. I agree that it is not suggested to use this but it DOES work.. I Have done this with my ICD as well as my Megafile 30. You can not access drive D or anything else though without a driver loaded.)

MS> You are ignorant of something _very_ funadmental here...

MS> Not to mention the fact that TOS 1.04+ lets you go all
MS> the way up to drive Z:,
MS> giving you 24 partitions...
Since when? As a registered developer I never got any information on the fact that Tos 1.04 has more then 16 total drives available? However it wouldnt do the original poster any good since he was running Tos 1.0.

MS> Ah. You don't understand at all. TOS has ___NO___ hard
MS> disk support whatsoever. There is no 'inherent hard
MS> disk driver' in TOS...
Oh yea? Remove your boot software on a HD with a normal partition on it and reboot your machine.. Drive C can be accessed. Although no other partition can be. I have done this in the past when the driver software died and I needed somethign quick like the original driver software which was in a directory on the HD. I was told by someone though that its not a good idea to use this since you could trash your drive but its there non-the less.

MS> The problem with other manufacturer's drivers not
MS> handling BGM partitions is the fault of the 3rd party
MS> manufacturer, not the 'limitations' of TOS.
I never said the BGM partitions had anythign to do with TOS other then being a special device driver. Last I had heard the 3rd party drives did NOT support
BGM partitions with their software yet.. (I was running ICDBOOT 4.2.2 last time I looked at it.) Beckmeyers (sp?) had his disk tools working with it but I dont think his drivers worked with it. At that time you had to run big partitions with the HDX drivers..

MS> Cluster size should never vary from 2 logical
MS> sectors... You are wrong there too, in that there is no
MS> 'cluster size in TOS x.xx' - TOS has no say in what the

MS> cluster size will be, and will happily handle any
MS> reasonable value you give it.
For one thing I was guessing on the difference between <1.04 and 1.04+ and their cluster sizes. (I said so too..) I never said cluster sizes were different at any time either. I know damn well what clusters are.. Just not how big they are for sure on the ST nor how many there are...

MS> I Reiterate... There _IS_NO_'NORMAL'_HARD_DISK_SUPPORT_
MS> AHDI is the driver for atari drives, if you use an ICD,
MS> then you use ICDBOOT, if you use a MAXXON, thenm you use CBHD, etc etc...
There is too hard drive support... It may not be fully there but it DOES work a little. My understanding was that the drivers from ICD and such extended this built in system. And the newer BIG partitions replaced the whole shemoo.

MS> Well, that's the biggest crock I've read in quite a long while!
MS> With TOS 1.00 and 1.02 you have a maximum of 16K
MS> clusters. With TOS 1.04+ you have 32K. Messy-DOS 5.00
MS> still uses expanded cluster sizes.

You should get out more often..
Besides, I said in the message I didnt have the exact figures but I know that it uses big clusters. The actual size is irrelivent the idea of them existing is what is relivent. So what if its 16k clusters or 32k clusters.
The smallest file you can use though is still 16/32k. No matter if this file is 2 bytes in size. That still will eat up a big drive alot quicker then using a few smaller partitions with smaller cluster sizes.

One last note to you...
In your message you attack me personally as if I was an idiot. With jerks like you I can see why anyone would want to go to another platform.
So what if I was doing it from memory instead of from book facts. The original poster was interested in the basic facts. I admit my post may not have been extremly accurate but you can correct my statements without attacking me personally. For the purpose it was intended for it was acurate enough.

Besides it doesnt change the fact that with pre tos 1.04 versions your limited to 16 meg. WIth 1.04 and newer your limited to 32meg. UNLESS you use the bigger partitions that have to be specially supported. And even then the cluster sizes are larger with larger partitions. YOu still have the problem of small files taking up ALOT of space and wasting most of it.

I can't help it that here inthe USA all our information is out dated... I shouldnt have to learn german to know how to setup a stupid hard disk..

The problem is very common, the solution, a new GST SHIFTER chip. A friend
of mine had an extra 1040STE laying around and exchanging the chips
solved the problem...of course, now his 1040STE works rather poorly.

I got the idea from a post from sweeden. We decided to give it a try
since the poster said the solution fixed the problem.

956. MiNT & Sozobon 1.33i `make'

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-01 19:57:34 UTC
From: bigham@hercules.acpub.duke.edu
Message-ID: <1594@news.duke.edu>
Source record: 45357

[I never can decide whether questions like this should go here or in the parent group. I've seen then in both places.]

I'm running MiNT 0.92 and whatever version of MiNTshel comes bundled with it (probably about the best I can manage on a 1MB machine), and I'm having a few problems, all of which seem to center round argument passing:

- sed108st from a.a seems to get confused frequently. A command as simple as:

```
sed 's/^a/b/' file1 >file2
```

confuses it; it tries and fails to read the file 's/^a/b/', and then crashes with an address error. If I proceed the command with a -e, it works properly, but that shouldn't be necessary, should it? Maybe with the new Sozobon mintlibs I'll try recompiling it and see what happens.

- And speaking of Sozobon, I'm also discovering interesting behavior with the `make' program from Sozobon 1.33i. When I attempt to run one of the MiNT file utils like `mv' from a makefile, the program gets _exactly_ the same arguments (typically none) as were passed to `make', right down to having "c:\sozobon\bin\make.ttp" in argv[0]. Worse, this also happens with some, but not all, programs I've compiled with Sozobon (notably, the Gnu flex port screws up, but the Gnu byacc port works fine).

Ideas?

> Or do they both go low anyway?
>

In answer to you questions:

The address and data information come directly from the 68k and the
ROMx select lines are from address decoders which return DTACK to the
68k internally. The DTACK return is delayed internally to compensate
for the fact that the port was originally designed for use with EPROMs.
UDS and LDS may be used with the select lines to select only one of
two eight bit devices onto the bus if desired.

A couple of assumptions and guesses can be made; that the address decoder
is gated along with address strobe (AS) and that the time from select
going active (ROMx) to data ready (on a read cycle) is of the order of
250 - 300ns (ROM timing when the ST's were developed around mid '80's).

From the 68k data book (at 8MHz):
i) DTACK low to data in (setup time) = 90ns max.
ii) UDS/LDS high to data invalid (hold time) = 0ns min.
iii) AS/DS width low = 240ns min.
iv) data in to clk low = 15ns min.
v) clk low to AS/DS high = 70ns max.

So in answer to your questions, the address information is guaranteed to
be fixed for at least 240ns. In reality it's probably closer to 500ns
given the setup time and the minimum AS time. The data must be valid 90ns
after DTACK has been returned if there are no internal delays. This is
probably closer to 250ns given that it's a ROM port. The data information
must be valid for (ii+iv+v) = 85ns min.

Under no circumstances can data be placed on the bus without one of the ROMx lines being active. UDS/LDS are toggling all the time when addressing other devices, and the cartridge port bus is not buffered (a contentious design issue).

To my knowledge byte instructions only affect the data strobe corresponding to that particular byte (UDS or LDS).

Sla/n go fo/ill,
Risky B.

All I know is what I read about it on GEnie, and then I don't even get that
right sometimes. :^) At this point, no one really knows what's going to be
in the 520/1040/MSTE version, not even George Richardson, its designer,
because it's still in the planning stage. He said recently that
the TOS sockets will be removed, the FPU support may be removed,
the bus for stuff like Chromax would most likely be removed, and there
would only be room for 4 SIMMs (4meg Fast-RAM or 16megs Fast-RAM when 4meg
SIMMs come out). Your best bet though is just to wait to see what evolves,
or get a TT. I'm planning on the latter for myself.

I get #1 sometimes when I boot the Mega STE, but it then it goes away after a few seconds. I think I read somewhere that it may be hard drive interference if you have an external one.

#2 is a reported problem as well. I don't hear it much at all any more. Someone speculated that as the computers get older, this problem goes away. I've had mine since July. The problem may also depend on the program/demo you're using.

Atari knows about #3. Bill Rehbock asked people on GEnie to report about it a few months ago. We haven't heard anything since. I think they were planning on offering a software fix. This only happens with a few programs.

960. Using GNU Make with TOS 2.06 / Varied Grumbles

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-02 06:50:45 UTC
From: atilghma@sdcc13.ucsd.edu
Message-ID: <29789@sdcc12.ucsd.edu>
Source record: 45361

I just received TOS 2.06 yesterday, so I've been working feverishly to set things up "just right" - so far, so good, except that I'd like to run GNU make when I double-click on a Makefile. And GNU Make doesn't like the fact that it's passed "e:\usr\nut\makefile" or whatever - is there a way to force the desktop to just run the program without passing a parameter? [I realise that I could modify Make, or write a "wrapper" shell, but why do it if the desktop can handle it?]
Is there a document describing what all of the options in NEWDESK.INF mean?
Does Atari beta-test its OS releases? [I've found numerous "little bugs" - nothing major, but little things which would normally be taken care of by a healthy beta testing stage. Maybe when I get my '030 and a real MMU I can fix all these problems by making myself a RAM version of TOS. Until then, though, I suppose I must plod onward! :-)
What say we bash down Atari's door and demand a RAM-loadable version of the OS? Perhaps ala TOS 1.0 (disk)? Maybe with periodic "hard updates" cast into ROM? I can't imagine Atari's too worried about people stealing RAM copies of TOS and running illegal ST emulators! (And people worried about OS-modifying viruses can stick with the ROM versions). This way people wouldn't be locked into using bugs which should otherwise be fixed... If Atari thinks that I'll pay another $60 for TOS 2.07, they're crazy.

-- adam

[Don't think I'm all negative about TOS 2.06 - I love it, and it's quite a change from 1.62... Well worth the $60 and having to solder the jumpers to my motherboard, since Atari didn't spend the extra $0.10 to put standard Pee-Cee jumper blocks inside...]

961. VDI functions, Sozobon C

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-02 09:48:32 UTC
From: tymbrimi@milton.u.washington.edu
Message-ID: <tymbrimi.699529712@milton>
Source record: 45362

Hi all, I hope this isn't a really stupid question, but I am just getting started programming VDI/AES and whatnot, bear with me...

I have been programming some examples from "ST Application Programming" on such things as drawing line, polyfills, etc with the VDI functions, and have come across a curious phenomena :

1) The program does an opnvwk() and appl_init() etc, using all the proper methods for setting up handles and virtual workstation. The program itself uses simply the v_pline function to draw an endless series of random lines. The program always compiles fine, and will run perfect *right* after a warm boot, no error/bombs at all. However, sometimes the program will stop working, it will bomb out with 2 or 3 bombs, and sometimes it draws the lines, but only in approx a 5x5 pixel in the top left of the screen. Is there something I am not doing correctly to close my previous program, why do I have to reset to fix the problem?
2) This on a related note, why can I not get this program to do anything in low res? It runs fine in medium res, and I have it all set up so it always knows the screen coords from v_opnvwk() and is not plotting anywhere it shouldn't be. Shouldn't the program simply run the same in low res, with the same VDI calls? I am confused, it does not do anything whatsoever in low res.

Ok that is all for now, it looks promising so far but I feel I have to know the answers to these problems before I go on, I am very interested in making "good" GEM programs that conform to all the necessary standards so as not to have any weird things happen and be portable to anyone's ST/TT/whatever.

E-mail replies ok, but maybe you should post because I know there are others just getting started on Sozobon, this might be a helpful point for them.

I too would be VERY interested in knowing you can attach more than one
drive to the Mega STe host adapter. I tried to find out myself ...

Me too.

Also, did anyone successfully connect a Quantum PD425S to the Mega STE
instead of the default Seagate ST157N.

I tried it and got an error during the partition process.

Any ideas ??

Comments are welcome.

I noticed that the BIOS Parameter Block (BPB) has a 16-bit flags field
as last entry. Does it have any other values other than 0 or 1 in its
specifications?

Also, have any of the fields been promoted to `unsigned int' since the
maximum disk/partition sizes have been increased?

When I bought my STe 1040, I also bought 2 (1 Meg Simms) to upgrade my memory to what I thought would be 2 1/2 megs of memory. After frustrating over the problems for a while, I poped the cover off the 1040 ST/E and took a look inside. I found the sims slots under the power supply cover. I found two simms in the slot. I thought that I would see 4 simms, (2 of 1 Meg Simms in slot 1 and 3) and (2 of 256k Simms in slots 2 and 4)

Before I call the vendor, and rant and rave about my missing sims, I would like to know that I'm really missing something.

Yea, Yea I know, just add two more 1 mega simms and all my problems go away.

PS. I sat down at a local show and saw the TT in action running X windows and Unix V.4, impressive. The only critcal problem might be disk swapping. The guy from Atari, mentioned that IDE drives might be available for the TT machine. Hot!

I have had a problem something like yours, but it had nothing at all to
do with GEM. The problem was with the fsize function. It would compile
fine, taking argv[1] as the parameter and a long integer as the return
value, but when the program executes all kinds of garbage is displayed on
the screen, with a little message about too many parameters, and then I
get two bombs. That makes no sense at all to me. Fopen accepts argv[1]
as the filename to be opened, so why shouldn't fsize?

I am using Sozobon 1.33i, by the way.

|>
You seem to have misunderstood my suggestion slightly - I certainly wasn't

suggesting only using powers of 2 as skip values - in my example the skip value was 6 - definitely not a power of 2. And I pointed that if you just round to an integer you do get substantial pitch errors.

The power of 2 stuff is for scaling the current position in the sample table -effectively you keep extra fractional bits and only round off when you fetch your sample.

|> You can also skip different amounts each time; e.g., skip 2, then
|> 3, then 2, etc. This might produce an even slowdown when taken
|> across the whole sample.

Exactly! Actually I just got email from paul@kagaku.se.fujitsu.co.jp which I'm including below. (He's got a problem with his news feed.) He gives a rather more accurate and elegant solution to the problem than keeping extra fractional bits. (I'm kicking myself for not of having thought of it! (I did my PhD on rasterization algorithms...))

I'm the person who called you a "cunt!" last week! I guess I should have toned down my language (like someone suggested "c*nt" (!!)) - sorry, but this is the way I speak in normal life, and I was really expressing surprise and admiration at the accuracy of your guess.

Well, you posted to the net how you thought multiple sample code could be written. Maybe I can help you out of a few difficulties here (I

have written at least 20 versions of such code)...

>The basic idea is to play all samples back a fixed frequency (say
>12.5KHz) and change the pitch by skipping data.

Yes, you've got the basic idea right.

>You first need to have your sample recorded (or interpolated to) a frequency
>(say 100KHz) much higher than your constant playback frequency. Now if the
>original pitch was say middle C and you play it back at 12.5KHz you'll be a
>couple of octaves low. But if you play it back and only use every 4th sample
>you'll be back at your original pitch. And if you play it back and use every
>6th sample you'll increase the pitch by a perfect 5th (in this case G above
>middle C). The general formula is (assuming an even tempered scale)
>
> (x/12) rec_freq
>step_size = 2 -------------
> play_freq

if you think about it, you will see that this 100Hz thing is
impractical. If you scale by 4 times, and use constant integer like
every 5th sample, you will find the pitch is nowhere near accurate
enough. Effectively, the fractional part of (rec_freq/play_freq) is
limited to 2 bits, which is not even close to enough. But even
4*exploded data would take up far too much memory for most
applications. Even in demos, 100k is a lot to splash out on music, and
that's about what you need for a reasonable 10 minutes of music,
without such scaling. In my tracker code, and anyone elses I've looked
at, what's used is a Bresenham error type algorithm to decide which
value to play now. E.g. for a rate of 2.5 times the original
frequency, you would skip 1 value, then 2, then 1, then 2 etc. My
code gives a pitch accuracy of int +16 bits compared to the int +2
bits in your method. In one version of the code, I was prepared to use
int +8 bits to gain an extra register, and slight speed advantage, but
the pitch innacuracy *was* slightly noticable, at least to my ears. At
a later rewrite, the speed advantage disappeared, so I went back to
+16 bits. Your method does improve the signal-to-noise ratio slightly
for some pitches. Consider with my method, the pitch of +7 semitones:
(like rec_freq=c play_freq=g). This is the worst case, as it is almost
1.5 * rec_frec (BTW not exactly, as you said, though your formula is
correct 2^(7/12) <> 1.5). With 1.5, the skips would be 0, 1, 0, 1
etc., adding high frequency jaggy noise. How noticable this noise is
depends on the sample, sometimes it doesn't actually sound bad, (like
for sounds that are already distorted anyway), but with your
oversampling, or interpolation, say doubling the frequency (and sample
size), and corresponding scaling up by 2 my Bresenham errors, the
signal-to-noise ratio could be improved. However in terms of
effect/cost, I don't think it is worthwhile to implement this in most
cases. It could be done simply using a good sample editor, and
subsequenly rewriting that line of the mod file one octave higher, if
you like.

>Now since all samples will have the same play back frequency (regardless
>of actual
>pitch) you can add them together with out difficulty. On a ST I believe there
>are only 3 * 16 levels of amplitude available so you will need a look up
>table to do the convesion. On the STe there are two 8-bit channels available
>and you can use the DMA to do double buffering - you only have to run
>an interupt rountine when one the current buffer is empty. The interupt
>code should switch the DMA reg to the 2nd buffer (which contains fresh data)
>and refil the old one. In this way you only have to use a small fraction of
>the CPU time to do sound precessing in the background.

As an STe owner, I must confess to being not so proficient with the ST playback method. I was wondering about the 3*16 amplitude levels. By experimenting with ST playback, I've noticed that channel 1,2,3, cannot be exchanged without introducing a strange hiss: e.g. 13, 11, 8 does not seem to be the same as 8, 11, 13 . It seems that the largest value must always go to the first channel, the next largest to the second channel etc. Is there any significance in this that you know of? Do the channels have slightly different weights? How were these values arrived at - maybe someone used an oscilliscope, and tried every possible combination of values on the three channels to get an approx. linear scale with approx. 8 bit accuracy?? There is a often included in ST routines a Volume-Boost button, where a different channel amplitude table is used. What are the exact characteristics of these tables? Wouldn't it be possible to have a larger table than 256 entrys, and then make some sort of whole tune, real-time volume scaler based on the existance of such a louder amp. table?

I've heard reports from INF. of our crew. He's in Luxembourg, and said GUNSTICK of ULM has come up with a way to play 8-track samples on the STF with just one write to the sound chip instead of the normal two! He's implemented a routine that plays 2 mod files at once!! This sounds just a tad unbelievable to me; I wonder if anyone knows any better?

As for STe code, in my routine, I used 3 buffers so I could put the routine in the vbl. This is because the dma chip doesn't shift an exact integer number of values per vbl.

>Paul claimed 15.5% vbi for (I think) two mono samples at 12.5KHz. This
>gives about (96cpu cycles & 24mem cycles) / (computed sample byte) which
>seems a little slow for linear code - but perhaps he is doing some
>fancy processing to keep up the sound quality. By the way if you want
>to loop samples you should scale your sample so that the loop is a
>power of 2 to avoid wrap-around checking.

I'm afraid you're in a bit of a dream-world here! I said 15.5% vbl for 4, yes FOUR mono samples at 12.5KHz. It was 48 cycles per 2 tracks I think, plus some extra code for the tune etc. just a couple of instructions. And of course it's linear code. Bear in mind for example that TCB tracker code has worse quality playback, clocks in at over 38% processor time, while it permanently uses up 2 data registers, and 5 address registers! I'd say in this light, my code is just a bit

better wouldn't you?!!! To get this speed, there was a slight omission I had to make - no looping of samples There may still be some way to get looping without sacrificing too many cycles, using some more self-modifying-code. I'm working on the user-interface of my ultimate sample-editor plus full-tracker at the moment but I think I'll have a look at my replay code again some time this week, and see if I can't get looping implemented.

***

By the way, you sound like a good enough coder to join our demo crew. Are you interested? Could you tell me what age you are, what you do or whatever? (I posted a description of our crew last week). We are also going to market our own games plus other software in the future, while at the same time having a lottafun! We want to become famous like the Bitmap brothers, and we intend to launch straight onto the next new home computer whatever it is instead of waiting 5 years like we did with the ST! Really, really, think about it; I promise you, we're gonna be famous!

My net-news reading system is a real mess here, and I've just been told I can't use it again this week. If you want, you can post any of this mail to the news.

> but not all, programs I've compiled with Sozobon (notably, the Gnu flex port
> screws up, but the Gnu byacc port works fine).
>
> Ideas?

Just guesses, since I'm not running MiNT:

-- You ran MAKE from some sort of shell that supports either the
Atari ARGV or the Mark Williams standard for extended argument
passing.

-- MAKE, since it was compiled with a library that knows nothing
about those protocols, left the command-line image in the
environment, which was inherited from MAKE by the child process (mv).

-- The child process ignored the TOS command line and read the
(outdated) extended arg information instead. This suggests to me that
the child process was compiled using a library that understands the
same protocol as your shell, and not the same library used to compile
Sozobon.

This is a pain in the aft region. A couple of people have said they
are working on updated, MiNT-aware libraries either based on dLibs or
based on MINTLIB. If/when they become available, they'll provide ARGV
support and this sort of problem should go away. Meanwhile, I'll
print out your note (and this response) and snail-mail it to Ian
Lepore.

Source record: 45370

I am not that familiar with my recently purchased (used) HD setup yet.
It includes a conner 44 meg and a syquest 44 meg removable drive with
an ICD adapter. I will often get write errors, and sense: 4 messages
when copying stuff on either drive. I assume this is a problem in my setup
but not sure where. The copying will stop, say data on disk may be damaged
(on the destination drive), then says disk full. The disk is definitely
not full. And if I simply attempt to copy what was not copied before this
I will be able to copy quite a few more before I get the sense error and
write errors. I have write verify on, and ICD utils 5.4.2 I think it is.
Since it works fine with continued copying, I assume it is in the setup I
have somewhere. Can anyone give me some info on what might be wrong or
where I might look for info?

Thanks in advance!

I would like to take Mr. J. Wine's message a little further and review the german edition. For further information on the english edition please read my other message posted in the comp.sys.atari .st conference. With the help of all ST Users the book might be published in the near future.

This is the original message that I received from Mr. Jankowski who is one of the authors. The second part is the translation to the german message (it was translated to "fit" the english language):

Mr. Jankowski writes:

Hi Mark!

Ich freue mich, dass Ihnen das Profibuch gefaellt.

Leider ist es uns Authoren bisher noch nicht gelungen, SYBEX davon zu ueberzeugen, eine englische Uebersetzung anzubieten. Ich werde Ihre Mail aber gerne zum Anlass nehmen, um eine neue Anfrage bei SYBEX-Deutschland zu starten. Vieleicht koennen Sie ja mal bei SYBEX-USA (in Kanada gibt es glaube ich keine Niederlassung?) eine Anfrage starten. Es koennen ja dann sein, da SYBEX-USA mal bei SYBEX-Deutschland wegen einer Uebersetzung anfragt!

Beste Gruesse
HDJ

Hi Mark!

I am glad that you enjoy the book (Profibuch).

Unfortunately we [authors] have not been able to convince SYBEX, to offer a english translation. However, I would like to take your inquiry as an opportunity to reopen this case at SYBEX-Germany and perhaps you could initiate an inquisition at SYBEX-USA. Per chance, SYBEX-USA might then petition SYBEX-Germany for an english translation.

Sincerely,
Hans-Dieter Jankowski

Review of the
ATARI Profibuch ST-STE-TT
by Mark Kovarski

Author(s): Hans-Dieter Jankowski
Dietmar Rabich
Julian F. Reschke
Edition : 10th Edition 1991 (September)
ISBN : 3-88745-888-5
Pages : 1492 pages
Publisher: SYBEX-VERLAG GmbH
Vogelsanger Weg 111
D-4000 Duesseldorf 30
Tel.:(0211)61 80 2-0
Telex: 8 588 163
Fax: 0211/6180227

Summary: The "ATARI Profibuch ST-STE-TT" (original title) is also refered as the "Atari Bible" which provides in-depth information on all series of Atari computers and is a must for every programmer and enthusiast.

REVIEW:
Over the last few months I have seen discussions going on several different conferences and different networks. The contents ranged from "What are the TT resolutions?" to "How many HD's can the SCSI-adaptor on the MSTE run?". Question like this can be easily answered if you have access to the ATARI Profibuch ST-STE-TT. The book consists of 1492 pages which are devided 5 parts. They are:

PART 1 - TOS - The Atari Operating System
PART 2 - The Hardware
PART 3 - The Hardware of the TT
PART 4 - Appendix
PART 5 - Index

Each individual part is than subdivided into different chapters. The are as following:

PART 1 - TOS -The Atari Operating System

Chapter 1: BIOS and XBIOS
Chapter 2: GEMDOS
Chapter 3: VDI-Operating System Routines
Chapter 4: AES-Operating System Routines
Chapter 5: XCONTROL
Chapter 6: Guidelines to Programming and Users Usage

PART 2 - The Hardware

Chapter 1: The Central Processing Unit
Chapter 2: The Graphics System
Chapter 3: The Sound Generator
Chapter 4: The MFP 68901
Chapter 5: The Serial Port
Chapter 6: The Parallel Port

Chapter 7: The ACIA in the ST
Chapter 8: The Floppy-Disk-Interface
Chapter 9: The Atari Computer System Interface (ACSI)

PART 3 - The Hardware of the TT

Chapter 1: Faster, higher, further - The MC68030 Processor
Chapter 2: Even Faster - The MC68882 Coprocessor
Chapter 3: ROM and RAM in the TT
Chapter 4: The TT Videocontroller
Chapter 5: And because it was so beautiful - Additional MFP in the TT
Chapter 6: A step in the right direction - The TT-SCSI-Port
Chapter 7: Serial but faster! - The SCC makes it possible
Chapter 8: The VME-Bus in the TT/MEGA STE
Chapter 9: The SCU in the TT/MEGA STE
Chapter 10: The clock in the TT
Chapter 11: Further on the TT

PART 4 - APPENDIX

Has everything from BIOS, XBIOS and GEMDOS Error messages to the pin layout of the chips. It goes even further and has much more.

PART 5 - INDEX

It is the entire index of the book with 46 pages in length.

This book is the number 1 selling ST book in germany and other european countries and it is understandably why. It has just everything you ever wanted to know about not only the ST but the STE/MSTE/STE/TT and even the Stacy computer. It is used virtually by all programmers in europe like Mr. Markus Fritze (author of Turbo Assembler), and Mr. Karsten Isakovic (author of SysMon) and many more.
The book is very structuarly organized and very easy to understand. The index is very well designed and anything can be found within seconds. The authors have also not only taken already available information and put it in the book but also double checked the existing sources and included not available information as well.
The TOS versions that are covered range from TOS 0.00 to 3.05. The are also many programming tricks and guidelines included that will enrich every programmers knowledge.
The second part which deals with the harware of the Atari series of computers has a very detailed description of the parts that are inside the Atari. Many schematics are included thus making it every hackers dream to built his own paddle controller or connect a PC keyboard to the ST.
Part 3 is the new addition to this book - The TT. It goes into the TT's 68030 and all the old/new parts of this computer. As

the chapter before, schematic are also included.
The STE/MSTE don't fall short and are also detailed described in it.
As a conclusion I have to say that this book is a masterpiece of literature. Prior to this I have used the "Atari ST Internals" by Abacus Software, the " Technical Reference Guide - Atari ST, Volume 3" by COMPUTE!Books, and the "Atari ST GEM Programmer's Reference" by Abacus Software. Even though you'll be able to find the information in all three books, you won't be lucky in obtaining any information on the STE,STE or the TT. They are just to outdated and cover only the ST computer. I have used the "Atari Profibuch ST-STE-TT" for a while now and I am truly amazed at the quality of it. It is surprising to see a book of this magnitude for the Atari since I am usually used to seeing similar literature only for the PC. The authors have done an outstanding job and hopefully a english edition will be published soon so the english readers can enjoy it as much as I did.
If you have comments/question please feel free to mail them to me.
Sincerely,
Mark Kovarski

Source record: 45371

Hm... I have a SyQuest 44 Meg drive also, although I have a ST-296N 84 Meg with it. I had some trouble getting everything working smoothly until all the resistor packs and the ID settings were just right. You may want to double and then triple check those.

Also, see if you can get another cartridge for the SyQuest and try that out.

Check ALL the connections.. it sounds stupid, but I opened my HD case one time, bumped a cable loose (slightly!) and had trouble for a while, until I pushed every cable nice and tight.

Hope it helps some....

971. QC1438 14 inch monochrome monitor ??

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-02 22:48:43 UTC
From: charltn@ccu.umanitoba.ca
Message-ID: <1992Mar2.224843.17587@ccu.umanitoba.ca>
Source record: 45372

I recently ordered a new monochrome monitor for my 1040 ST after
the untimely death of my SM125. I ordered the monitor from Atari
Canada in Toronto. Today I called to inquire about the status of
the order and was told that since the SM125 was no longer available
they would be shipping a QC1438 14 inch monochrome monitor. Does
anyone know anything about this monitor? Is it a recommended buy, or
should I be looking at something else. Any information or advice
would be appreciated.
Thnx jim... charltn@ccu.umanitoba.ca

It will work right now in a 1040ST if you have it in a tower case. Someone
on GEnie has it connected to a 520ST motherboard.

Good idea. This sounds like a very good application for a
Bresenham Algorithm. Just map input to X and output to Y.
Or is it vice versus :-], don't you just love Bres., but really
it would be simpler than Line Bres, since you'll only use one,
possibly two octants (half quadrants) rather than all 8 which
must be carefully catered for with line drawing.

Source record: 45382

I've noticed noise problems with my TT. With my ghetto plugged into my RCA outs on my TT, I get subtle noise in the background. As different things appear on the screen, the noise gets louder/higher-pitched or quiter. The noise is louder the whiter (ie, the more white) there is on the screen. Does this have to do with my TT monitor (which is on the TT) or some internal circuitry in the TT which is too close to the RCA out wires? Is this the same problem that others have been experiencing?

>Yea, Yea I know, just add two more 1 mega simms and all my problems go away.

I'm confused. What's the problem here?

If you're saying that you have 2.5MB of SIMMs but only 1MB of memory (according to what your memory tester tells you), then I think this is the solution:

The STE MMU prefers to have the same amount of memory in each bank. If you have 2MB in one bank and 0.5MB in the other, it will configure to a 1MB machine. What you need is SIMMFIX.PRG, which reconfigures your STE for 2.5megs. You can get it from atari.archive and PD libraries.

>PS. I sat down at a local show and saw the TT in action running X windows

> but not all, programs I've compiled with Sozobon (notably, the Gnu flex port
> screws up, but the Gnu byacc port works fine).
>
>Ideas?

This is because Sozobon doesn't know about the ARGV standard. What happens is:
1. The shell puts ARGV into the environment and runs make.
2. Make struts it's stuff, and then runs mv, with the old ARGV still
intact.
3. mv finds ARGV, and thinks, "Hey, an ARGV, these must be my
arguments."

What I did was to use a precompiled GNU make to build a new pdmake with the
MiNTlib port to Sozobon I did (which is now on a.a as pl18, but you'll need
a few additional patches to compile it under 1.33i, which should appear in
pl19). Thus, the new make knows about ARGV, and doesn't pass it through.

I remember first meeting this problem over a year ago when I first started
experimenting with MiNT, in the days before I could run the GCC. The way I
solved it then was to run make via a weeny little program which simply strips
the environment of ARGV and then runs make. I don't have the program still,
I'm afraid, but it was real easy to write.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

This is puzzling. There's no runtime check on this, so I can't imagine where
such a message could be coming from. Can you post an example program that
exhibits this behavior?

> get two bombs. That makes no sense at all to me. Fopen accepts argv[1]
> as the filename to be opened, so why shouldn't fsize?
>
> I am using Sozobon 1.33i, by the way.

The following compiles and executes fine.

/* filesize.c: print the size in bytes of a file to stdout */

#include <stdio.h>

int
main(argc,argv)
int argc;
char *argv[];
{
long fsize();
if (argc<2)
{
usage();
return -1;
}
printf("fsize(%s): %ld\n",argv[1],fsize(argv[1]));
}

usage()
{
fprintf(stderr,"Usage: filesize <filename>\n");
}

Well the New mono monitors that have bean quoted a few times are the
SM 144 for the ST/E line of computors and the SM 147 for the TT line,
I don't know about the Mega STE, the SM 147 does not have a speaker,
they are claimed to be 14" monitors, but from what I have read they
are no biger than my SM 125, ie, 12" diagonal screen size...

985. ARGV

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-03 14:14:04 UTC
From: lunnon@qut.edu.au
Message-ID: <1992Mar3.091404.43497@qut.edu.au>
Source record: 45378

I've been messing around with some ARGV startup code and revelations
have come to light like :

gnu exec does not do ARGV properly:

This means that recently released shells do not do argv right
but then it could be my fault... hence this message.

Brief ARGV

telltale command tail size of 127 to be placed in basepage
buffer if ARGV used.

in environment

VAR1.
VAR2.
...

ARGV=IOVEC\0argv[0]\0argv[1]\0 ... argv[n]\0\0

From what I can see this varies from the mwc definition in
2 fundamental ways.

1. The requirement for the command tail length to be set to 127
2. argv[0..n] are separated by nul characters rather than spaces
(to allow args with embedded spaces).

GULAM being mwc fails
ALL the other shells (except maybe bash which doesn't work for me)
fail to put the 127 in but I'm not yet sure about the spaces instead
of nuls.

Question: does ANYBODY know of a shell and a make utility that does
the ATARI _STANDARD_ ARGV or do I have to implement a kludge just
because everyone else has

until then

aaaarrrrgggggg V

Ed> SIMMs come out).

Seriously though, 4 meg SIMMs are already out!! There exist even 16
meg SIMMs! Do you mean that they're incompatible with the SST?

Not yet, if you mean, the mupfel could work in the background while working with the desktop.

> certain picture viewer programs.

Yes, I was one of the posters on the net about these things.
Although Lars-ERik (Norway) found the solution of the SHIFTER Chip.

I got a new shifter chip from Atari (Netherlands/Benelux),
but unfortunately, it didnot repair anything!

I never tried to play sounds with my MEGA STE, but I sure do have the
screen flip problem. ALL MEGA STEs do have these problems!!!!
Atari told me, that they knew the problem (september last year) and
that's why they gave me the new chip. In fact they gave it to
my local dealer which replaced (it was sockened) the chip, as
my MEGA STE was still under warranty then...
They told me that theywould come back on this, but I never heard anything
anymore, leaving me (and everybody else!) with a faulty machine.

I can immediately reproduce the effect with some drawing programs.
I do not have the list handy, but I know that at least DEGAS
(no, not degas elite) has it. I also remember a program that
was on the disk of the commercial version of fast copy pro program that
did it too.

Just start up those programs, flip a few times from drawing page
to command page and visa versa, and voila, there it is.
In most situations, only one flip is sufficient to get it.

Sorry,
no solution from atari yet.

John

This is not a stupid question. In fact, you've come to the right place to be guided to asking the right question. Others may be able spot the difficulty immediately, but for myself, I would request some more information.

You seem to have the basic procedures. I would ask you to reduce your code to the most basic test code that still produces the problem and then post or e-mail it. (For example, if you don't need the 'spiro-graph' function call to crash the program, leave it out.)

I've written a demo program which sounds very similar to what you describe. I'll dig it up for you if you'd like.

991. Decoding GSTMCU rom outputs

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-03 16:53:05 UTC
From: dba@jet.uk
Message-ID: <1992Mar3.165305.5976@jet.uk>
Source record: 45296

hi

I have a question about the GSTMCU chip in the STE.

What are the decoded address ranges of the GSTMCU I/C outputs:

pin output used address range
L14 ROM0 no ??
N15 ROM1 no ??
K13 ROM2 XROM2 $E00000->$E3FFFF Tos 1.6, 1.62, 2.06
K14 ROM3 XROM3 $FA0000->$FAFFFF Cartridge port
L15 ROM4 XROM4 $FB0000->$FBFFFF Cartridge port
J14 ROM5 no ??
J13 ROM6 no ??

The interesting thing is that the Tos ROMS are 1Mbit devices but the
I/C holders are 32 pin which means that 4Mbit devices could be used if
the wiring is changed!
Think about it - a UNIX kernel in ROM, with its own filesystem for
/dev/tty perhaps?

Time to get out the old logic probe!

thanks
dennis

MMm, well, since it worked for a friend of mine, I suppose I will have to get the manufacture date, and serial number when on spring break.

If I make it through my mid terms and don't die of exhaustion...it will take a week to recover anyway, I'll post the results as soon as possible.

Source record: 45307

Hi,
I've been reading this News group again and I have some questions that
maybe someone could be bothered to help me with.

1. I've seen lots of mentions about Tos upgrades, how can I tell which
version of Tos I have in my machine?, I brought it in UK in 1988.
How do I go about a Tos upgrade?. Is this a hardware instalation.

2. I would like a hard drive, what is the best and cheapest route to go.
I was thinking along the lines of building my own.

3. Memory upgrade,at the moment I have 1meg but I would like to 2.5mb
I have the 32 40256 soldered in ram chips at the moment.

Thanks

Nick Coyne. European Space Operations Center, Darmstadt, Germany

The SST has slots for 8 SIMMs of fast ram, and still uses the (necessary)
slower, normal Atari ram, allowing up to 12 meg (4 slow, 8 fast). I would be
extrememly surprised if it was able to use any SIMMs above 1 meg (it adds to
the complexity of a device).

995. ST and Rainbow TOS ???s

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-03 22:44:53 UTC
From: freds@hpcc01.corp.hp.com
Message-ID: <1550006@hpcc01.corp.hp.com>
Source record: 45326

Does anyone know of a patch for
a MEGA ST using the rainbow TOS 1.4

I have installed the 1.4 TOS about
a year ago and found that a few of my older
programs no longer run. Various errors.

Even some games have quit, such as Gold runner.

I would need to be able dial in with a 1200 baud modem
or get the patch on floppy.
This is because I am on a protected system at HP that
excludes FTP and all the other goodyies to NON-HP
systems. Even at that I'm on a disc less node in a cluster.

Oh second item:

Does anyone have a phone number for the atari ST systems
in Sunnyvale?? (Not voice)

My email address is freds@hpprsd1.mayfield.hp.com

or try freds@15.3.33.115

Thanks

997. Comeau C++

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-04 01:56:08 UTC
From: steve@thelake.mn.org
Message-ID: <A251926628@thelake.mn.org>
Source record: 45302
Cross-posted to: comp.sys.atari.st.tech,ctdl.lang.c++

I ran across the following press release and thought it might be
of interest. I have no personal knowledge of the product.

COMEAU RELEASES ENHANCED VERSIONS OF MULTI-PLATFORMED C++
Support for ANSI C++ Templates Now Available

Comeau Computing announced today the availability of Comeau C++ 3.0, its multiplatformed C++. Comeau C++ 3.0 provides C++ template support and other enhancements. The product will begin shipping February 17, 1992.

The new release includes support for ANSI C++ templates which further support the promise of OOP by enhancing the code reuse capabilities of C++.

"Comeau continues its tradition of being the first to support the latest developments in C++," said Greg Comeau, CEO of Comeau Computing. "The high quality and timeliness of Comeau C++ 3.0 will hurl Comeau further into its leadership role in the overall C++ marketplace."

Comeau C++ 3.0 will be the only version of C++ supporting templates classes and template function on a number of platforms. Templates, descriptions of families of common functionality, allow developers to write a generic description once. Templates also reduce the amount of code developers need to write.

Comeau Computing also announced its intent to provide support for numerous back-end C compilers and additional ports of Comeau C++ 3.0.

"Comeau C++ was the first to support C++ 2.0 and for over a year was the only vendor to support the C++ 2.1 specification. Continuing in this tradition, Comeau's leadership role and commitment to C++ and object-oriented programming and technology is upheld with our support of templates and other post-2.1 C++ features," said Comeau.

COMEAU C++ ALLEVIATES TRANSITIONS

C++ provides a bridge for C programmers to enter object-oriented programming and obtain other serious improvements. Comeau C++ 3.0 provides another bridge to allow C programmers access to this technology and to increase their productivity. Comeau C++ 3.0's strong compatibility with ANSI C and ANSI C++ is a steppingstone toward this goal. C++ programmers gain the ability to express their algorithms in a more natural manner while still retaining the efficiency of C. Furthermore, C programmers can move to C++ without having all their code break and they can learn Comeau C++ in a tiered transition.

Furthermore, Comeau C++ is designed with cross platform and cross operating systems capability in mind. Consistency across implementations is of the utmost importance. Previous versions of Comeau C++ supported MS-DOS, all UNIX 386's, SCO UNIX 386, SCO XENIX 386, the AT&T 3B2, AmigaDOS, AT&T UNIX PC 7300 & 3B1, the Sun-3, and the IBM RS/6000 AIX. Comeau C++ 3.0 adds support for the Sun SPARC, and others to include the Atari ST, UNIX SVR4, MS-Windows, and OS/2.

"This diversity has been an important concern to our user base. They want to develop source code here and and then go use it there. They want to specify generic interfaces to ensure portability. They need compilers on their target machines. They want to be assured that what worked on the source machine will work on the target with no hassles or strings attached. Not only do we address these considerations, but we guarantee them." commented Comeau.

C COMPILER SUPPORT

Comeau C++ 3.0 is a licensed port of AT&T's cfront, the de facto standard C++. Comeau C++ 3.0 is a full and true compiler that performs full syntax checking, full semantic checking, full error checking and all other compiler duties. Input C++ code is translated into internal compiler trees looking nothing like C++ or C. Instead of generating an internal proprietary intermediate code from these trees to be used by a proprietary back end code generator, Comeau C++ 3.0 generates C code as its output. Besides the technical advantages of C++, the C generating aspects of products like Comeau C++ 3.0 have been touted as a reason for C++'s success since it was able to be ported to a large number of platforms due to the common availability of C compilers. The C compiler is used merely and only for the sake of obtaining native code generation.

COMEAU COMPUTING

Comeau Computing is a leading international software house dedicated to C++ and OOP featuring timely and robust spec compatible C++ ports for various platforms and operating systems. Comeau is also involved in C++ libraries, toolkits, debuggers, browsers, and training.

What is the "3.0" in Comeau C++ 3.0 With Templates?

The Major Features of Comeau C++ 3.0:

* Multi-platform, multi-OS capability.
* Support for proposed ANSI C++ template classes and template functions
* Support for nested types (the transition model initiated with
Comeau C++ 2.1 is now complete).
* Source and link compatible with Comeau C++ 2.0 and Comeau C++ 2.1.
* Improved architecture, reworked internals and better organization.
* Support for overloaded prefix and postfix increment and decrement.
* Support for constructor and destructor syntax for built-in types.
* Support for protected derivation.
* Support for fully default argument'ed constructors initializing arrays.
* Completed transition in support of dominance to data.
* Completed transition in support of access specifiers in unions.
* Argument matching transition complete.
* Operator overloading transition complete.

* Many anachronistic transition models are complete and diagnose as errors.
* Continuing the transition: many +w diagnostics are now default diagnostics.
* Support for an unlimited number of nested include files (unlimited to the "extent of intent" as, for example, your C preprocessor may have limits).
* Improvements to the ANSI C +a1 option controlling input and output.
* Further ARM/ANSI C++ compliance.
* Strengthening due to more powerful C++ test suites.
* Bug fixes.
* Under MS-DOS, the Comeau C++ 3.0 compiler proper will use the now industry standard DPMI protocol (previous versions supported VCPI).
* Continues it support of 32-bit processing.
* Free technical support.
* Low price.

Third Party Support

Comeau C++ receives support from third-party library and tool vendors. Furthermore, Comeau C++ is the choice of compiler to use by many C++ text book publishers and C++ training groups. Comeau C++ 3.0 will continue to receive this support.

How do I order Comeau C++ 3.0 With Templates?

If you currently possess a version of Comeau C++ 2.1, ordering of Comeau C++ 3.0 With Templates is as follows:

o if your license is > 60 days old, cost is 50% of the purchase price you paid
o if your license is <= 60 days old, cost is 25% of the purchase price you paid

(Either way provide us with your 2.1 serial number).

If you do not possess a version of Comeau C++ 2.1, ordering Comeau C++ 3.0 With Templates can be obtained by contacting us through those mechanisms listed below.

Orders will follow previous Comeau policy (prepaid, US dollars, etc).

Contact:

Comeau Computing, 91-34 120th Street, Richmond Hill, NY, 11418-3214 Marge Behrens 718-945-0009 (voice) or 718-441-2310 (fax) BIX: comeau, Compuserve: 72331,3421 Usenet: attmail.com!csanta!c++ Prodigy: tshp50a

998. Monitors for a TT!!!

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-04 05:48:46 UTC
From: cummins@a.cs.okstate.edu
Message-ID: <1992Mar4.054846.28982@a.cs.okstate.edu>
Source record: 45298

Well... I just made it to the point where I can afford a multisync and get the two (ST) monitors off my desk... However, I'm also within spitting distance of being able to afford a:

TT

or a:

SST with a graphics card...

My problem is... I want the 1280x1024 resolution of a TT in mono mode! but I don't care to kiss color goodbye! Is there a box I can put between my TT and a multisync that can feed the mono signal to it in a form that can be used? If not... I recon the SST will do the job. But I'll sure miss the ports!!! (megatalk? maybe....)

jc

>
>3) If the 68000 accesses the cartridge port memory in byte-only move mode
>(used for memory-mapped I/O), does only one of {UDS, LDS} go active (low)?
>Or do they both go low anyway?
>
1c) the data must be hold as long as ROMx/ Data Strobe are active.
2) There must ALWAYS be one of the ROMx lines active, otherwise you will get
bus conflicts which may lead to defective hardware.
3) On word accesses, both go low. On byte accesses, only the appropriate one
goes low. However, it is possible (and does not cause any damage) to put a
whole data WORD on the bus, even if only a byte read is requested. This may
simplify bus logic.

Okay. The code you posted only differs from the code I wrote in one
significant way. I didn't have the "long fsize()" declaration in my
code. Other than that, nothing was really different for that function
call. I also used the ltoa function to convert the long value returned
by fsize to a string, but even after removing the segment of code to show
the value and convert it the program still bombed. The error message
might have come from Geminii. When Geminii bombs out (frequently, with
some programs) it pops up an alert to tell the user about the error. But
since the file was a program file, rather than a TOS file, it should have
shown an alert instead of text and it should have not shown all that
garbage. I'll re-code the program from the bottom up (I destroyed most

of it trying to figure out what was going wrong) and I'll let you know how it works. I'm not a C programming God (Grin!) so it may be I am doing something exceptionally stupid and relying on C to be friendly and tell me about it. At any rate, I'll find out and let you know.

(I wonder if it could be Geminii causing the problem? I've noticed that it bombs out on the strangest programs. ST Zip 1.1 and UUE.TTP are two that come to mind. They run fine from the desktop but bot at all from Gemini. Very strange.)

That's logical isn't it? How else would you be able to read the driver software from harddisk every time you boot? The driver would have to be on a floppy disk!

This is wrong. All current GEMDOS versions can only handle 16 logical drives.
You need a GEMDOS replacement (MiNT) or a GEMDOS extension (MetaDOS) to
get more.

Don't even _try_ to get more without these programs -- this will scramble
internal GEMDOS structures. Use the return value from Dsetdrv() (LONG!) to
find out which drives are there.

Aha! I found out what the problem was, I think. I'm inept! :)
Actually, it has to do with the way I was passing parameters. The
function wanted a pointer to something, and I just gave the identifier.
I had several more bugs that had the exact same circumstances while I was
trying to figure out the problem, but it seems to be working now. I just
need some more work on how to supply functions with the exact stuff they
want. I wish C was a little more like Pascal in that it enforces
typecasts. If a function wants a pointer to an array of integers, the
compiler forces you to give it that and nothing else. Anyway, as I said,
the problem was caused by a mistake on my part. I still don't know why
ST Zip and UUE bomb out, though...Another day! :)

For all who are interested.
I've a file called NTREPLAY.ARC that contains a MOD player at 17KHz.
This is in assembler, I compiled it and it works. It uses some tables
for the samples (??) Quartet style (??). If you'ld like to have it
send me E-mail. The sound is very clear when using this program,
when playing some MODs there is (most of the time) more different
sounds then with other programs (I don't know if the program makes it
up or MODs contains more sounds then most players can reproduce)

Rod, please remember those carriage return's. Just because your editor
word wraps doesn't mean everyone else's does.

Now, while the article you responded to here was a little incoherant,
the poster was essentially correct. BGM partitions are done by increasing
the sector size, and as a cluster, by definition, is 2 sectors, the
cluster size is increased. Thus large cluster sizes are an ineffecient
way of storing small files and large amounts of space are potentially
wasted.

As to having to use Atari's HDX to format drives, this is true, as
Atari refuses to support the Supra/ICD extended partition scheme , and
will damage data on a drive formatted with those utilities.

Also, the 16 - 32 meg change was done in TOS 1.4, so there must be
some hard drive support in TOS.

Now a question for some one who knows a bit more about hard drive
formatting. I'm running a usenet node on a Syquest cart. As most Usenet
messages are about 2k, would formatting the cart to 1k sectors, making
clusters 2k reduce fragmentation on the expire, add, expire cycle?
It would seem if most articles fit in a single cluster, they'd be
less likely to fragment as the new articles were written in the
unallocated clusters. Of course a 2056 byte article would use 4k, which
would be a bit wasteful. What if I made the clusters 4k?

Also, would another cart formatted with the normal 512 sectors confuse
the driver software?

Somebody is out to lunch here! I own a SM147 (the manufacturer's model number is QC1438) and it is indeed a 14" Paperwhite VGA display with no speaker. I have been using this monitor for about a month now and I have no complaints - its much easier on the eyeballs instead of lookin' at that SM124 tiny screen and the Spectre GCR Mac screen is huge (almost like a Sun desktop :))

The declaration is absolutely necessary; without it, C assumes that
fsize returns an int. With Sozobon C, that's 16 bits. The returned
value would be truncated.

> Other than that, nothing was really different for that function
> call. I also used the ltoa function to convert the long value returned
> by fsize to a string, but even after removing the segment of code to show
> the value and convert it the program still bombed.

Be very careful that you get the arguments to ltoa right. Why do I say
that? Because I just ran a test to make sure ltoa works properly, and I
managed to bollix up the arguments. :-)

The right way:

```
#include <stdio.h>

char *ltoa();

main()
{
char buf[128];
long l;
l = 12345678L;
printf("l = %ld\n",l);
printf("l = %s\n",ltoa(l,buf,10));
/* number, buffer, radix */
}
```

It's easy to swap buf and l, or forget the radix.

> The error message
> might have come from Geminii. When Geminii bombs out (frequently, with
> some programs) it pops up an alert to tell the user about the error.

Gemini (Mupfel) complains any time a program passes a garbage value
to Pterm(). If a program exits ungracefully -- i.e., reaches the end
of main() without either calling exit() or specifically returning a
value -- there may be trash in register d0, and the C runtime startup
code (dstart.o) will pass that trash to Pterm(). It gets back to Gemini,
and you get an error message. A program that actually bombs also may leave

trash in d0, which I suppose is the theory behind Gemini's error dialog.

> (I wonder if it could be Geminii causing the problem? I've noticed that
> it bombs out on the strangest programs. ST Zip 1.1 and UUE.TTP are two
> that come to mind. They run fine from the desktop but bot at all from
> Gemini. Very strange.)

That's probably a separate problem. When testing the beta versions of the Heat and Serve C package, I tried it from Gemini and got bombs right away. The problem turned out to be something in either the dLibs startup code or in the dLibs memcpy routine. Ian fixed it, and I don't know the details, nor do I know why it manifested itself with Gemini and not with the Desktop or other most shells.

If you run a program that was compiled with the original, ancient release of dLibs, it'll bomb under Gemini (and also with some other programs, such as Micro RTX). If you run a program that was compiled with any of the updated versions of dLibs from a.a.u.e, or the library that comes with the Heat and Serve package, you won't get bombs on program launch. I don't know about ST Zip, but I'm certain that there are a couple of versions of UUE.TTP floating around that date back to the original dLibs and contain the fatal bug.

1010. Need source code for file selector

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-04 18:43:09 UTC
From: johnl@stardent.com
Message-ID: <1992Mar4.184309.9261@avs.com>
Source record: 45310

I would like to use a customized file selector dialog box for my
application. It should look pretty much like the standard one but
I'd like extra buttons so a user can view different groups of files
by clicking on a button rather than using the keyboard.
For example, buttons:
*.NEO
*.PI1
etc.
would allow the user to see different types of image files and ignore
the rest.

Could anyone provide some hints on how to do this or point me in the
direction of some source code? Is the scrolling file list really a
"window?" I've done a fair amount of work with GEM but can't figure out
how to place a window on top of a dialog box. If it's not a window,
what is it?

Please send replies by direct e-mail because our newsfeed is very
flakey. Sometimes we get news OK. Sometimes we don't for a long time.

Thanks!

1011. Improve your emacs

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-04 19:23:43 UTC
From: ntomczak@vega.math.ualberta.ca
Message-ID: <ntomczak.699737023@vega>
Source record: 45311

Recently I tried emacs 18.57, as ported by Scott Kolodzieski
(scott@sparc1.stevens-tech.edu), on my friends TT with a big mono
monitor and I found that a display is really slooow.
A reason for that turned out to be fairly simple. Emacs goes
to a great length to optimize display routines and adjust them
to all kind of terminals. It takes its information about
the terminal from a termcap entry. If you will tell there
that adding or deleting a line is free then, well, it behaves
accordingly. To inform emacs that these operations have actually
some cost - insert some amount of padding (it does not mean that
you terminal is really doing any padding at all; just makes
costs non-zero). Numbers after '=' sign are doing that and '*'
means that these are costs per display line.

Effect of this change were immediate and a display, even though
still not a speed daemon, improved markedly. Also status line
stopped jumping up and down a screen instead of stayin' put on
its rightful place. Padding values are taken from my ceiling
and I had not time to experiment so it is quite possible that
you will get better results with a different set. In this case
please post your results here.

Please remember that termcap routines from the current version
of emacs dislike strongly '\r\n' line terminators in termcap files.
So use emacs itself and binary mode to make changes (makes for
a nice hen-and-egg problem in case of termcap troubles, since
emacs will not run without it). You have to restart emacs
before it will notice that you made some modifications.

If you would like to play with sources you have another method for
improving display speed. File dispnew.c is using, in quite a few
places, safe_bcopy() routine. If your library bcopy() is safe anyway,
in that sense that it handles overlapping regions correctly, you
may use it instead of supplied quite primitive safe_bcopy().
This applies to bcopy() from gnulib.olb, for example.
The simplest way to do that:
insert line '#define safe_bcopy bcopy' between '#if defined(atarist)
...#endif' brackets and surround code for safe_bcopy() by
'#if (!defined(safe_bcopy))...endif#' pair.
Gains in a display speed are noticeable but surprisingly small and
not worth to bother if you are not doing some other code hacking at
the same time. At least on TT. I don't know about ST effects.
(Just to add more confusion - I was using modified bcopy() which
unrolls its loops in both copy directions. Watch incoming
releases of gnulib sources for that attraction.)

Have emacs fun,
Michal

1013. Source code to display spectrum pics?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-04 23:28:53 UTC
From: atilghma@sdcc13.ucsd.edu
Message-ID: <29960@sdcc12.ucsd.edu>
Source record: 45314

Does anybody have some code to display Spectrum 512/4096
pictures? I had it on my HD, but that was many moons (and many
crashes! :-) ago... (I checked on atari.archive, and nothing showed
up when I did a grep'ed for "spectrum" in the Index...)

I was checking some FTP sites in Europe and in one place there was
a file called ROMRAM. This was a program for the TT which supposedly puts your
TOS from your ROMS into RAM for the computer to use from there, and gave a nice
speed increase too. (But I am not entirely sure as I cannot read Swedish or
German -- not sure which language it was in)

> What say we bash down Atari's door and demand a RAM-loadable

Can the TT not protect any part of RAM from being modified by
any program other than the OS? I thought the 68030 with MMU provides
such features.

Not strange, it's a feature of Gemini. If a program started with Pexec
bombs out, Pexec will return -1, if the programs terminates normal, Pexec
will return the program's return code. And if a programm ends with a return -1,
Gemini thinks it has bombed out and shows you two bombs and the well know
altert box....

Could you elaborate? One thing I'd really like to see would be a copy
operation that scoops up as many files as free RAM allows before writing
them to their destination. Currently copying from floppy to floppy is a
right royal pain in the TOS.

> What say we bash down Atari's door and demand a RAM-loadable

I think most Atari offices have a secret back door for such contingencies.
What you suggest for ROM versions is exactly what I said to deaf Atari ears
ages (>2 years) ago and is obviously the most coherant solution.

1019. 1040STf external keyboard - Info wanted.

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-05 12:03:56 UTC
From: biwidar@cs.few.eur.nl
Message-ID: <1992Mar5.120356.18661@cs.few.eur.nl>
Source record: 45318

Hi there,

Could anyone tell me whether (and if so: how) I can use an external
(PC/AT) keyboard for my 1040STf ? Do I need a hardware extension?
Is it compatible with all kinds of emulators etc.

Thanks in advance,

Irsan Widarto (biwidar@cs.few.eur.nl)

1020. Strange memory ext. for the 520STE

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-05 14:25:19 UTC
From: doucet@ripolin.laas.fr
Message-ID: <7065@laas.laas.fr>
Source record: 45319

Hello all,

a friend of mine have got a strange problem with a
memory extension for his 520 STE:

after some reflextion, he decided to upgrade his computer
to 1 Meg. This had been done at the shop where he bought it.

Back home, he ran FastCopy III which told him he had 4 Meg
of available memory... ?!?!
InteramDisk (ram disk in a D.A.) told the same thing...

BUT, when loading files into a 1.2Meg ramdisk, the screen began
to fill with strange multicolor lines, after having loaded
850K (approx.)... Looks like the file was loading into
the 'screen memory'.

We then decided to run SYSINFO (very nice program) in order
to have all infos about the machine and system; funny results:

total memory = 4.2 Meg
avail memory = 4.05 Meg
installed = 2 MB + 512 KB

In fact, there IS 1 Meg, but TOS (or anything else) leads to
think there's 4 Megs...

Many program crash, mostly drawing programs, since they try
to use the largest memory, and are fooled into thinking
there are 4 megs...

Have anyone encoutered this problem, and can give some clue
about it (though the 520 had made its way back to the store) ?

Thanks in advance.

Well.. I have a 520STfm, so its fairly similar to your computer there. What I have is a Deka Adapter. To install it, you cut a small notch on the side of your computer for a modular jack. Put a connector over your keyboard jumper pins. Then, plug an IBM Keyboard into the Deka Box.

now, i don't have a 101 Key keyboard that you need to get all the keys, but I have some old cheap IBM keyboards that were given to me, and they work find for most things...

>at the same time having a lottafun! We want to become famous like the
>Bitmap brothers, and we intend to launch straight onto the next new
>home computer whatever it is instead of waiting 5 years like we did

Hold on! It has been 7 years since the latest of Home computers was
introduced, the ST. (Amiga, around that also). Something has obviously
been keeping anyone from making a NEW home-computer. (And for those
who dont understant, I mean home-computers such as Atari 8-bit, Commodore 64,
Spectrum, Amstrad, ST, Amiga. Not TT (souped up ST) or Amiga 3000, etc)

Its a shame, though. The home computer I am using, a 6 year old ST which
I got when I was 14 (by the way, its 6 yrs and 5 days old) started out
being used only for playing games and programming in basic(s). And I remember
it had "the best" graphics around, and boy was "Time Bandit" a killer. When
will someone come out with another one of these things? So all of us can
run out, buy it, and program stuff for it?

When the ST came out, it was the best "home computer" anywhere for the price.
(the Amiga coming in second, because of the price)

Ideally it should not be compatible with ANYTHING... That way one can start
afresh. A new OS, etc. Re-invent the wheel, BETTER. Not having instant
limitations imposed by the need to have compatibility to this, and to that.
One can leave that to the Power-PC or new Macs, ST's, PC's.. Something
like the ST was when it first came out. Tons of RAM for real cheap, a new
OS (TOS) that even used a MOUSE. Graphics and Sound. Something made for having
FUN with as well as someday using it for other stuff. No software was available
for it, which encouraged people to invent new stuff... Perhaps I am
daydreaming, but it was like that 7 years ago. The ST made it on the cover
of BYTE magasine. A refreshing sight after seeing PC's and $10,000 NeXTs.

I guess I just want MY chance, like you, now that we are prepared, to get
our hands on a "new" machine and make the equivalent of DEGAS and FLASH for
that machine, just as Tom Hudson and Alan Page did for the ST when it came out.
At that time, all I was interested in was buying the machine and using it.
Whereas there were others who saw a new machine and a potential for getting
to be well known, etc. Look at where Tom Hudson is now! (Probably working
for some graphics company and getting paid lots of $).

Just as many other teenagers may grow up using the next generatio
home-computer. Someday, they'll be running software that is as cool as
Calamus is for the ST, on that machine... Made by us.

>with the ST! Really, really, think about it; I promise you, we're

From: rosenkra@convex.com
Message-ID: <1992Mar06.024956.7066@convex.com>
Source record: 45339

```
i am having problems with scanf in GNU lib at patchlevel 71. it
does not seem to work. nor does anything if input redirected
(in shell, gulam). is this a known bug and is it fixed in pl 72
or 73? i run tos 1.2, no mint. GCC 1.40, gas 1.38, gnu-ld whatever.
no UNIXMODE set (unsetenv).

example:

% cat tst.c
#include <stdio.h>
main(){char s1[1024];
fgets(s1,1000,stdin); printf("%s\n",s1); exit(0);
}
% gcc -o tst.ttp tst.c
% tst

it hangs here, no matter what i type. ^C of course kills it. setting
UNIXMODE to "b" does not help. same behavior if scanf (what really
prompted the investigation in porting croff). this also hangs, as i recall:

% cat dat
lsdklfksdlkfsl <-- cr/lf at end of line
% tst <dat

The problem is that TOS 1.60+ has a bug in its memory sizing method that TOS 1.4 and less does not. Basically it assumes that both banks are the same size if the both exist. The first bank size dictates the second bank size so a 2.5Mb machine is configured as either 1Mb or 4Mb. SIMMFIX sets _phystop to $280000. I modified it to also configure the MMU correctly but I think this is a pretty useless solution anyway when you consider that it must be on every disk you boot with and won't work with bootable games software.

Atari should fix the bug.

1031. Trouble reading hard disk boot sector

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-06 11:13:00 UTC
From: ralph@laas.fr
Message-ID: <RALPH.92Mar6121300@orion.laas.fr>
Source record: 45193

I have written a small utility which dumps disk information of both floppy disks and hard disks. When I try it on my hard drive (SH 204 - formatted with an old version of HDX) I get a decent looking BPB but the bootsector info seems to have some discrepancies (partition C is 4Mb in length):

BIOS Parameter Block of drive C:

Sector Size: 512
Cluster Size: 2
Cluster Size: 1024 bytes
Directory Entries: 16
FAT Length: 18
Start 2nd FAT: 19 (0013)
Start Data: 53 (0035)
Clusters: 4397
Flags: 0001

Boot sector of drive C:

ID: 3C 0 E0 4E 75 24 48 65
< ` N u $ H e
Serial No: 2377829

Sector Size: 512
Cluster Size: 2
Reserved Sectors: 1
Hidden Sectors: 8310 < Seems suspicious, no?
Sectors/Track: 11888 < Likewise
Heads: 11379 < What a disk!
Total Sectors: 8848 < Looks OK!
Media Desc: 73
No. FAT Tables: 32 < Shouldn't this be 2?
FAT Length: 18
Directory Entries: 256

I read the boot sector with Rwabs into an Intel-order MS-DOS structure (which works fine for floppies). Normally, a hard disk has the same boot fields as a floppy, hasn't it? Just some partition info. appended to the end, right? Also, are all fields in Intel order?

Maybe the erroneous fields above are not even used. Also, what serves the system variable hdv_rw (0x476) when Rwabs can access all disks? I suppose that hdv_mediach is there for those Syquest drives.

As a last, my disk was formatted with TOS 1.0 and now I have TOS 1.02.

Thanks to all,

1033. Geminii and GDOS

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-06 12:55:53 UTC
From: D.M.Johnson@newcastle.ac.uk
Message-ID: <1992Mar6.125553.11863@newcastle.ac.uk>
Source record: 45195

Hi,
When I have installed and use Geminii, usign AMCGDOS.PRG the program works fine with no problems but if I replace AMCGDOS with GDOS from say TimeWorks Geminii complains that is can't load the fonts as GDOS may not be installed. All I change is AMCGDOS to GDOS.

Is AMCGDOS suppose to be a replacement for GDOS that is completely compatable?,

Another question. I went to my bank to ask about transfer of money to paid for Geminii, as suggested by the authors, however the bank told me it would cost and extra 12 quid on top of
the shareware price bringing the cost to about 40 quid (curret exchange rate),a little bit steep on my bufdget at the moment. Do you kno what other forms of payment they take and also
do you think the bank has been telling porkies and it really should not cost that much.

Cheers

Dave J

[BIAS ALERT: I work for the company who makes the OS which IMS has licensed]
[for the machine I'm about to discuss!]

In <1992Mar5.175939.20875@jsp.umontreal.ca> u1398@JSP.UMontreal.CA (Kosmatos Odisseas) writes:
>Hold on! It has been 7 years since the latest of Home computers was
>introduced, the ST. (Amiga, around that also). Something has obviously
>been keeping anyone from making a NEW home-computer. (And for those
>who dont understant, I mean home-computers such as Atari 8-bit, Commodore 64,
>Spectrum, Amstrad, ST, Amiga. Not TT (souped up ST) or Amiga 3000, etc)...

[I believe these details are accurate, but don't hold me to them!]
Actually, several new "home" computers have been introduced, just not from companies who can afford to make the media splash that Atari, Commodore, Apple, or IBM can. One of the more promising machines IMHO is the MM/1 from Interactive Media Systems. It is based on a 15MHz 68070 (compatible with the 68000), includes reasonably adequate video capabilities - programmable resolution up to 720x540 (w/16 colors from a 16 million palette, more colors at lower resolution). Multiple serial/parallel ports are supported, SIMMs, HD PC-compatible floppy drive, DMA stereo sound. Cost is, I believe, around $1200 for a nicely-configured system. You should be able to call 800-information for number for IMS, or, worst case, try (202)232-4246. Or ask in comp.os.os9.

>Ideally it should not be compatible with ANYTHING... That way one can start
>afresh. A new OS, etc. Re-invent the wheel, BETTER. Not having instant
>limitations imposed by the need to have compatibility to this, and to that.

Well, not quite - it runs OS-9, which I consider an advantage. (See BIAS ALERT above.) OS-9 is a robust, multi-user, multi-tasking OS, and on the MM/1 has a fully-windowed GUI. The advantage is that there is tons of source code out there which can be easily ported to the MM/1 (from 6809 systems and other 68K systems). Unix code can also generally be quite easily ported. Many tools are also available (debuggers, compilers, etc.) so the basic tools needed are already present. The MM/1 comes with a C compiler.

>I guess I just want MY chance, like you, now that we are prepared, to get
>our hands on a "new" machine and make the equivalent of DEGAS and FLASH for
>that machine, just as Tom Hudson and Alan Page did for the ST when it came out.
>At that time, all I was interested in was buying the machine and using it.

There are many talented people working on programs, utilities, and system-level tools for the MM/1, and I believe source code is widely available. It's really an excellent hacker's machine. Check out comp.os.os9 for details.

>sure miss the ports!!! (megatalk? maybe....)

Jim Allen asked GEnie users about this about a month ago (maybe earlier). He proposed a device that would let you use TT high without requiring another monitor. However, I don't know which monitors are capable of this, and I don't think there is a monitor that would be able to handle 1280x1024 plus the ST color resolutions (on an ST), in case you were thinking of buying the monitor now to use on your ST and then keeping it when you upgrade to a TT with the device. I highly recommend you give Jim at Fast Tech a call.
His number is 508-475-3810.

1036. Problem reading floppies on GCR

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-06 20:43:39 UTC
From: kawakami@ocf.berkeley.edu
Message-ID: <44076@ucbvax.BERKELEY.EDU>
Source record: 45333

I'm having trouble reading Mac formatted disks on the Spectre GCR.
Usually, the first few floppy disk operations (copies, directories, etc)
work fine, then the machine locks up: no keyboard, no SHIFT-HELP, no
mouse. It seems to happen only on reads, not writes. In addition, it
seems to happen when reading the directory or doing some disk management.
It seems to happen more when I'm using a diskette formatted on a Mac with
a different System installed (I think it was 6.0.3).
My system is a 4Meg ST with Spectre GCR. I have an NEC drive mech
which has been modified to work with the Spectre. I am running Apple
System 6.0.5. The only non-Apple Init I'm using is SoundMaster. SAM and
Virex don't find any viruses.

Source record: 45337

Programs linked with mntlib's startup code only check the command
tail length bye in the base page if mntlib was compiled with a
macro __STRICT_COMPATIBLE_WITH_STANDARD__ (or something like that,
don't remember exactly) defined. With the GNU library it's
probably the same. Therefore, these programs don't check if the
ARGV information in the environment is valid, and they will fail
if they were started by a program that doesn't understand ARGV (but
themselves were started by a shell that knows of ARGV).

Perhaps it's that why you have problems.

Hope that helps,
Michael

I found a way to get rid of the problem with ST Zip. All I had to do was place "setenv STZIP_PRG "x:n"" in my mupfel.mup file. This stops Geminii from using the ArgV standard, which ST Zip does not seem to like. It works fine after I do this. Steve Yelvington also told me that my version of UUE.TTP might have been compiled under the old Dlibs, which would explain why it bombed out since programs compiled under the old Dlibs don't work with Geminii for some reason. Problems solved...

1040. Spectre GCR and DEKA troubles!

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-07 12:40:29 UTC
From: kawakami@ocf.berkeley.edu
Message-ID: <44077@ucbvax.BERKELEY.EDU>
Source record: 45211
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I recently complained about possible problems with the GCR in mac mode.
I think it actually is a problem with not enough current running to
all the addons. This can bode badly for the GCR's writing to Mac disks
which should be done with as much current as necessary.

---------->8 Cut Here 8<-----------------------------------

WARNING! DEKA, and GCR users!

Using Spectre with any of the IBM keyboard adapters can cause trouble
with writes onto GCR (Mac format) floppies. As the GCR draws power
to write, the DEKA shuts down because of reduced current. I don't
know if this is the case, but the logical evidence is convincing.

1) When using mac disks in mac mode, the system appears to freeze.
The keyboard seems to be locked up, though the caps lock light
goes on. This makes it appear if there is a defect with the system
software.

2) Using the shift key, control key, or alt key sometimes causes the
shifting key to "stick". This seems to happen most when more
than one shifting key is used. This seems to indicate that as
more current is used, the keyboard interface gets flakier.

3) The keyboard and mouse also stick when using GCRTEST.PRG!!! So it
happens when GCR is used in Atari mode too!

Thus I conclude that it is the pair of dreaded 74373LS ICs which must
be replaced with 74373HC ICs.

The April 1992 Issue of Radio-Electronics magazine explains how to hook up a SNES to an Apple IIGS, Sony, and Commodore 1804 RGB monitor.

I'd like to know how to do it on the ST's SC1224. The problem is that the ST monitor (as well as the IBM I think) has a Vertical and Horizontal Sync controls. The SNES onlt has a Sync output.

How can I get around this?

Why should Atari support the ICD partition scheme? Is it not the other way
round? ICD should support Ataris standard scheme introduced with AHDI 3.0
in 1989.

>
>Why should Atari support the ICD partition scheme? Is it not the other way
>round? ICD should support Ataris standard scheme introduced with AHDI 3.0
>in 1989.

Well, ICD does support Atari's extended partitioning scheme, and has
since it was introduced. They also support the Supra scheme, introduced
over a year prior to AHDI 3.0, as Atari gave no suggestion as to an
extended partitioning standard, until one already existed, supported
by ICD, Supra, and BMS. Then Atari introduced their own. I suppose it's
not actually accurate to call anything not set by Atari a _standard_, so
let's just call it a convention adopteted by every third party vendor, in
the absense of a real standard.
The problem is not even that Atari chose to go their own way in chosing
a standard, so much as that their driver not only fails to recognise the
other partitioning scheme, but will destroy information on a drive formatted
with it. Other companies software recognises both schemes and works equally
well with a drive formatted on either.

1045. STe 16/8 Mhz and Floating point Coprocessor

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-09 03:56:15 UTC
From: bmw@swanee.ee.uwa.oz.au
Message-ID: <bmw.700113375@swanee>
Source record: 45197

I'm posting this for a friend of mine. who just purchased a Mega STe.
He would like to install a hardware switch to select between 16Mhz and 8Mhz.
He's very handy with a soldering iron and would like to know if anyone else has done this so he doesn't have to figure out himself.

The next problem has to with installing a Maths copro. He has a Copro from
his old machine (MEGA ST) and plugged it into the Mega Ste. It didn't work.
He has since discovered that he needs a GAL to make it operate correctly.
The question is what GAL? Where does he get it? Has anyone else done this?

Thanks for any help.

>Gemini thinks it has bombed out and shows you two bombs and the well know
>altert box....

Well, not exactly:

1. It is the BIOS exception handler which does the Pterm(-1) for the
current process (starting with TOS 1.04).
2. Gemini assumes, that a program is crashed, when Pexec() returned this
-1.
3. Gemini NEVER draws bombs directly to the screen, instead it shows an
alert box with a bomb icon. IF there are 'normal' bombs in the middle
of the screen, they were drawn by the BIOS exception handler.

1048. MegaST internal DMA pinout ?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-09 09:46:29 UTC
From: tmp@doc.ic.ac.uk
Message-ID: <1992Mar9.094629.24866@doc.ic.ac.uk>
Source record: 45201

Hello,
Does anyone have the pinouts for the mega ST dma port ?

I have a STFM and have got hold of an ICD microST host adaptor, which is designed for the mega. This comes with a 24 way IDC to plug into the mega's dma socket. My STFM only has the 19 way D-type external connector.

What I want to do is map the 24 pins onto the 19 pins and make a cable to match the two. I would imagine that the mega's internal dma port is simply an extension to the external port, or am I missing something ?

Any help appreciated.

Cheers, Trev..

ralph@laas.fr (Ralph P. Sobek) writes:

>Correction, my sofware reads *logical* sector zero (0) of hard disk
>partitions, *not* the boot sector of a hard disk. How does one read
>the boot sector of a hard disk?

For each partition there is a separate boot sector. To find the sector
numbers of the boot sectors you have to analyze the root sector (logical
sector 0). The structure of the root sector concerning the partition
scheme is more or less complicated on a drive partitoned with HDX 3.0 or
newer. Refer to the AHDI 3.0 RELEASE NOTES to get the information you need.

1052. MC68010 and TOS 2.06

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-09 14:52:57 UTC
From: vince@sci.kun.nl
Message-ID: <1992Mar9.145257.5005@sci.kun.nl>
Source record: 45203

Hello *.*

Some time ago there was a lot of talk about installing a MC68010 CPU in an ATARI ST. Since then, I haven't heard about it. Did someone actually try it or what? In the March issue of ST Magazin, there is an article about TOS 2.06 in which they mention an ST with TOS 2.06 and MC68010 runs perfectly, with a few exceptions (some games). This 68010 executes some instructions a bit faster (They say QIndex gives 115% for CPU shifts). Now what I'd like is a Hypercache Turbo Plus with a 16 MHz MC68010 in it, which should give an average speed increase of about 200%, whereas "ordinary" 16 MHz 68000's stay at about 150% - 185%, depending on the Cache RAM size (16K or 32K).
Now I've seen the question a lot of time, but it won't hurt to ask again: WHERE CAN YOU GET A 16MHz 68010???
I'll keep on looking for it, and ask GE (the guys from Hypercache) wheter they sell their boards without processor, and what the total operation would cost.
If anybody knows anything more about this subject, please post your experiences!

Thanks,

Sander SToks.

Same here in the UK, the Acorn machines are much cheaper (for equivalent kit) than what Atari have to offer. Come to think of it most computers of equivalent power are cheaper than Atari!

1054. FATSPEED

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-09 16:07:24 UTC
From: cstdxas@warwick.ac.uk
Message-ID: <m36fbz5v@csv.warwick.ac.uk>
Source record: 45204

Is there a more recent version of FATSPEED than the one currently on a.a (dated 1989, but really even older), or is there another program that does the same job (Other than TURBODOS, which is several years old as well)? The reason I ask is that I had a look at FATSPEED.PRG the other day and it appears to have been written in a particularly bad version of C. From what I saw I could reduce the code size to less than half and probably double the speed using assembler.
It would be hard to work from a dissassembly through - does anybody have the source, or does anybody know how to contact the author? Alternatively does anybody have a good description of the FAT and directory structure?
Also, isn't the byte order in these structures the wrong way round to give MSDOS compatability? You don't need this on a hard disk, so things would be alot faster if you stored things in the natural byte order on hard drive partitions - does any version of TOS do this?
Does anybody know how the UNIX filing system works at a low level? Is it more efficent than the MSDOS way of doing things or is there a price to pay for the long filenames? I'm thinking of writing a replacement hard disk fileing system that would operate only on certain partitions. The long filenames would be quite handy for MiNT users.

I opened a 520STE once to put two more 256K SIMMs into it. It had SIPPs too but they were socketed. I then spent half an hour soldering pins onto the SIMMs which then plugged in just fine. Not somthing I'd really want to do again though.

1056. ICD&parity

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-09 17:28:45 UTC
From: sakari@laureline.cs.hut.fi
Message-ID: <1992Mar9.172845.19404@nntp.hut.fi>
Source record: 45206

My current SCSI host adapter doesn't support drives whose parity cannot be disabled. I've been thinking of buying the ICD Advantage adapter that appears to have something called 'parity generation'. However, I haven't been able to get any hard and fast info from ICD on this.
So I ask any ICD users out there: can one hook a drive whose parity cannot be disabled (looks like an emerging standard) to an ICD Advantage and have it work with a MegaST?
Thanks,
Sakari

Which UNIX file system are you referring to? Remember, there are
currently two big divisions: AT&T UNIX, and BSD UNIX. What I know from
the BSD UNIX file system is that it is both much faster, more flexible,
and more what you want for your money (than MSDOS, GEMDOS, VMess...).

o) BSD has symbolic links
o) BSD has LONG file names (something of 1K, 2K comes to mind).
o) UNIX will cache file buffers much better (using various
buffering schemes).
o) UNIX has the concept of file system mounting from day one
(zero). This makes it very expandable.
o) The UNIX use of single,double and triple indirect blocks take
care of a much nicer interface than FATs (it's much easier and
faster to get the number of a disk block).
o) I could go on ... Perhaps I'm too much hooked on UNIX to care
anything about systems that call themselves an O.S. 8-)

Cheers,
Leo.

D>can't load the fonts as GDOS may not be installed. All I change is AMCGDOS to
D>GDOS.

All Atari gdos versions have one known bug: They demand programs to put the result of Getrez()+2 into work_in[0] before the v_opnvwk() call. The only way to see the correct fonts: Copy the screen font list to the 01p entry in ASSIGN.SYS.

But I'd rather recommend the use of AMCGDOS or NVDI. Both of them are much faster and less buggy.

Greetings,
Patrick

1061. 32000 color mod

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-10 08:11:01 UTC
From: sslee@micromed.net.netcom.com
Message-ID: <39ueHB3w165w@micromed.net.netcom.com>
Source record: 45213

I was wondering if anyone ever tried the 32,000 color mod by Barry
Orlando. I started the project and then ran into some problems.
I talked with Barry, but unfortunately he sold his ST and therefore
could not help me.
He had a different motherboard than the one I have (mine is an
old 1040ST, CO70789). The external jumpers referred to
non-existent pins. Thanks for any info.

Steven

Hi all TT-Users out there ! NOW LISTEN !!!

Do you want to have 32 MB of TT-Ram(Fast Ram) in your TT ??
Of course you want ! But the Price ??

Now the price is .....3200,- DM ! No, I've still got my senses
and I do not try to cheat you !! It is 3000 DM cheaper than
other solutions but is working the same. (The same speed,
the same quality etc. etc.)(e.g you don't need to be an Hard-
ware Expert to install it - just plug it in the Slot and voila !
The Memory is (e.g.) 36 MB RAM (my TT has 4 MB ST-RAM also).

So connect:

Richard Jelinek
Flurstr. 78
8510 FUERTH
0911/798069 (infos)

May the Powerful TT be with You !! :)

1064. Graphics libs for use with G++ 1.39 on the ST?

Source record: 45216
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

This summer I'd like to try producing 3-d graphics on my ST using FSF's GNU C++ compiler. Checking out Atari archive, there are two libraries, gemlib.zoo and gemolb.zoo; which one do I need? Also, are there libraries for producing graphics with MGR under Mint? I'd rather make stuff there than under GEM if possible. Also, is there any documentation for these libs? I heard once that the GNU GEM library was based on Mark Williams C and those docs may be used; c'est true?

Thanks for the info.

I don't know.... I had the same exact experience when I switched GDOS from the
EasyDraw disk and the AMCGDOS that came with Gemini - I never fiqured out what
the problem is and hence I'm still using AMCGDOS instead of GDOS.

This is *NORMAL* GCR behaviour. It has absolutely nothing to do with
a lack of current, voltage or anything else.

>2) Using the shift key, control key, or alt key sometimes causes the
> shifting key to "stick". This seems to happen most when more
> than one shifting key is used. This seems to indicate that as
> more current is used, the keyboard interface gets flakier.
>
Maybe. Could also be a problem with your DEKA keyboard. Generally
it's not nice to bang on the ST's keyboard while the GCR is doing its stuff.
Dave's done a good job of bulletproofing the code, I have absolutely
no kind of proof, but I suspect a flurry of keyboard interrupts might
still screw things up. I know there used to be a bug that locked up
the Mac if you moved the mouse too much while it booted.

>3) The keyboard and mouse also stick when using GCRTEST.PRG!!! So it
> happens when GCR is used in Atari mode too!
>

Again, this is perfectly normal behavior. Isn't it mentioned in the
manual somewhere?

>Thus I conclude that it is the pair of dreaded 74373LS ICs which must
>be replaced with 74373HC ICs.
>--
>John Kawakami kawakami@ocf.berkeley.edu
> ucbvax!ocf.berkeley.edu!kawakami

Incorrect conclusion. While you may indeed have a problem with
the bus driver chips, mouse and keyboard lockups during GCR activity
are *NOT* a symptom of that problem. Inability to write (but still can
read) Mac format disks no matter how much you tweak the pot in the GCR
is a more likely symptom. That might also point to a shielding
problem with an internal drive in a Mega. If you are not having
problems reading and writing Mac disks (aside from these 'lock ups'),
then leave your ST alone. If it ain't broke...

BTW, you didn't mention what type of ST you are using. To my
knowledge, the driver problem was primarily restricted to Mega 2's and
some Mega 4's. Hope this helps.

>____________________ correct me if I'm wrong ______________________________

Master. Since version 5.5 (1988!).

+ Mark-Williams ARGV (works for Pascal too, unlike Atari's)
+ xArg-Method from Dale Schumacher
+ PBP/ARGV-proposal of Allan Pratt (made prior to the new standard)
(+ the Master-oldie LC from versions before 1987)
+ ANY combination of the above

Everything is tunable with the shell-variable XARGS (set to an integer with the
following meaning for the bits (numbered 0-15 from right to left):
0 PBP-verification (if not set use $$)
0 or 1 ARGV-passing
1 not 0 ARGV[0] is I/O-vector
1 handle 2 points to CON: instead AUX:
2 xArg-passing
3 pass 127 as length in the basepage (as used by MWC-tools and the
Atari standard)).
The shell-variable UNIX alters the passing style of the environment, where the
bits mean:
1 every letter can be masked with \ (' ' too)
2 in extended arguments pass / as delimiter for dirs instead of \
1 or 3 * is the default pattern for all files instead of *.*
any value > 0 means that the environment is passed in unix-style:
var=value\0var=value\0 ... var=value\0\0
as opposed to the old Atari style (found in the ROM for PATH):
var=\0value\0 ... var=\0value\0\0
If UNIX is set, the Master syntax for wildcards (eg ranges [a-g] or *a*.?o) is
passed to all programs when they use Fsfirst/Fsnext. If you don't like this,
there is another variable with the bitmap style: VIRGIN
0 do not use GEMDOS/BIOS extensions (and _shell_p) of Master
1 do not allow software write locking of drives (with lock/unlock)
2 do not protect Master against redefinition of the keyboard
```

3 do not pass the wildcards to Fsfirst/Fsnext
4 no i/o-redirection done by Master
5 do not protect Master against redefinition of the color palette
6 do not convert filename case when passing them to the OS and
allow for longer names than 8+3 (provided by the module xfs.mmx)

Master 6.0 is available for anonymous ftp in /pub/atari/shells on cs.uni-sb.de.

This is true, I looked at it some time ago, too. However, you do not need
Fatspeed at all when using TOS 1.04 or above, so I think the effort of
improving Fatspeed would be wasted.

The ICD advantage does handle parity and it works fine with Mega STs. Note,
however, that the ICD micro hostadapter does *not* handle parity !

1070. Making a DMA port interface

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-10 22:06:07 UTC
From: bwhite@oucsace.cs.OHIOU.EDU
Message-ID: <5148@oucsace.cs.OHIOU.EDU>
Source record: 45223

I've been working on a physical ramdrive for my 1040ST; I had originally intended to stick it on the cartridge port, but after working out the glue needed to do writes sanely (i.e., other than "read from control location, read from address location, read value"; instead I had "read from control location, read from start location, read n values to write autoincrement/decrement") ... I decided it might be simpler to do a DMA interface.

So I'm looking for comments from people who've done interfacing with the DMA port. In particular, all I'm interested in is having an arbitrarily large chunk of RAM, and being able to read from / write to it at high speeds. The driver I can write.

In particular, the Atari docs are somewhat difficult to understand. Supposing I call this "device #5" for example, I need to know how the 1040 requests data, how it writes, etc. Bus timing information would be a definite plus.

Thanks ... running my 1040 as a Unix box could really use a high-speed, small /tmp drive... and I've got some old RAM chips sitting around ...

1071. AES evnt_multi with MiNT: Busy waiting?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-10 22:09:30 UTC
From: wr@bara.uucp
Message-ID: <yQ.VtZvlrsA@bara.uucp>
Source record: 45269

Hi,

it seems that AES applications do busy waiting when using evnt_multi
calls under MiNT... other processes (e.g. top running on a terminal)
seem to get no cpu time while the application is waiting for an event.
Using Fselect before evnt_keyb is easy, but how about evnt_multi
waiting for msg events? Is there any way to put an application to
sleep entirely while waiting for an event?

Could it help to write an acc that executes Syield every time it
gets control via AES?

I hope you can help me...

There's a version on the atari archive (atari@atari.archive.umich.edu);
it's called ME310S I believe. (It uses the file selector).

See the FAQ for comp.sys.atari.st for more info in the atari archive.

I had such a good response to my last question, heres a couple more for your perusal.

I have a monitor (OK, Ill admit it, it's a Sinclair QL Monitor, I was given it free!). I have no documentation for it but am almost certain its a simple RGB input. I want to know if I can hook it up to my atari st. I have tried just linking the R G B and a sync and get an almost recognisable picture but it is very faint and rolls a lot. Is this a voltage level problem? what can I do about it? Any suggestions appreciated.

Question two I have been trying to install Pinhead (aquired from the cover disk on Public Domain). On booting up I get the welcome message but then the ST resets, boots up again, welcome message, resets. And so on.
Anyone know what I am doing wrong??

Finally I would like details of any sites IN THE UK which archive ST software (I know about lancs.pdsoft).

Thanks in advance,

David Braziel.

>>>pardon my English but my German is really horrible<<<

For my ST I bought a Teac FD 55 GFR 5.25"-drive and put it
in my tower. Connected the Drive_Select_1-signal from the
soundchip with pin 12 from the internal shugart-bus.
Installed the drive as D1.
However it won't read, write or format the normal 720Kb-

works. Can I only format 360Kb and 1.2Mb on this drive or
should I make some jumper-connections for the drive to work.
By the way, I haven't (yet) adjusted the WD 1772 for
HighDensity-use. I use the drive only for 720Kb-use.

Who can help me?

Hello *.TEX

Could somebody please tell me what the best TeX-package for the Atari ST is? I know there is a CS version, but the a.a also has a 'normal' TeX 3.1 which is MiNT aware, if I remember correctly from one of the READMEs. And in a German mag I read that there is a MultiTeX version, which is a CSTeX especially for MultiGEM. But this is _NOT_ freeware, and besides, I don't have MultiGEM. Instead, I use MiNT and MW2 (for the time being; I'm writing my own windowmanager) and I guess there are a lot of people with this setup. So: which TeX feels itself good in this environment?

Thanks,

Sander STOks

1079. Some answers

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-11 12:23:30 UTC
From: elendir@inf.enst.fr
Message-ID: <1854@ulysse.enst.fr>
Source record: 45239

Well, the hardware switch is hardly possible. The only way to do it
properly is to add a two->one multiplexer, cut the 16 MHz, 8 MHz and
68000 CLK signal, and patch them into the multiplexer. Alternatively,
you may replace the 8 MHz signal by the clock signal form the PAL.

Regerding the COPRO GAL, I have the JEDEC disassembly of the GAL ; thus
if you want to program one, I can send you the fuse map.

Now the 68010. It's true since TOS 1.62, every processor can run on a
ST (68K/010/020/030/040). The 010 is a bit enhanced, since it supports
faster instructions, and has an internal 3 words cache for loop mode.
However, the 010 has quite run out of production, since very few
people used it. The 020 completly superseded it. So it might be VERY
difficult to find such a chip. Furthermore, I hope you have a PLCC support
because most of the 68010 are now PLCC chips.
The problems with games should be
1. The MOVE from SR, which is priviledged on 010 and higher processors.
2. The stack frames, which have not the same format.
3. Timings, which differs slightly, since the 010 is a bit faster.

Enjoy,

Vincent.

Source record: 45226

I'd like to do myself the memory upgrade of an Atari 1040STfm :
it has motherboard marked C103414-001 REV.1.1 and MMU marked C100109-001(9/89).

Now the problem: soldered on the motherboard there are eight NEC 424256-10 flat
pack ram chips. I think these are 4x256k chips, but I don't know the pinouts.
I am aware that a little hacking will be necessary to do the upgrade, but
I do not intend to spend money for a commercial upgrade kit (BTW, I already
have 1M chips around)....

If anyone knows the pinouts or has already done a similar job, I'll
be very grate for any information.

E-mail is preferred, I will summarize to the group.

Thanks in advance.

I have a small PCB that takes 68020 and it replaces the 68000 and
an other one that switches processors. They are bare boards, so
no components on it and I have photocopies from that German magazine
c't that designed that card.

I am happy to send them to someone interested. I am not expecting
any money out of it (perhaps something for postage) or if someone
wants to have my EPROMmer for $100 I would happy to send the PCB's
with it. Please email me if interested.

>Were can I get details of this MOD..?? Thanks..

You can find a text file with a description of this mod at our Atari archive.

We, Computer Science department, Utrecht University, are running an
anonymous FTP server on one of our systems. In addition to the FTP
service we're also running a mail server, for those of you without
direct Internet access.

--> How to get '32k colors mod' via anonymous FTP:

Site: archive.cs.ruu.nl [131.211.80.5]
Login: "anonymous" or "ftp"
Password: your own email address (you@your_domain)
File: ATARI-ST/doc/32kcolor.zoo

--> How to get '32k colors mod' via e-mail from our mail-server:

NOTE: In the following I have assumed that your mail address is
"fred_flintstone@stone.age.edu"; of course you must substitute
your own address for this.
** PLEASE USE VALID DOMAIN ADDRESSES. DO NOT USE ADDRESSES **
** WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET **

Send the following message to
mail-server@cs.ruu.nl
or the old-fashioned path alternative
uunet!mcsun!hp4nl!ruuinf!mail-server

begin
path fred_flintstone@stone.age.edu (SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/doc/32kcolor.zoo
end

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:

send HELP

A complete "ls-lR" listing of the archive is kept in the top-level
directory, it will be updated every night. To get it, issue the command:

send ls-lR.Z

That's all for now. If you encounter problems using the FTP service
and/or the mail-server, feel free to drop me a line (by e-mail, please).

Ate Brink
Moderator of the Atari archive at the Utrecht university
Email: ate@cs.ruu.nl or atari@cs.ruu.nl

It's an integrated controller chip: basically a CMOS 68000 clone with MMU,
dual DMA channels, timers, clock generator, UART, IIC bus, all onboard.
Allows making a more inexpensive and robust system. Been around for years.

We had wanted to use another integrated cpu, the Motorola 68340 (020 core;
other nice stuff), but it wasn't quite available at the time of design.
Nowadays, the 68EC030 would also be a good choice (super cheap 68030).

It's almost comically easy these days to come up with a very nice, cheap
system, by just using off-the-shelf parts. Unfortunately, most companies
simply use them to make copycat PClones instead. How boring...

best - kevin <kdarling@catt.ncsu.edu>

1086. Internal speaker on the TT...is it possible to disconnect?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-12 07:18:43 UTC
From: genius@sys6626.bison.mb.ca
Message-ID: <wPNiHB2w164w@sys6626.bison.mb.ca>
Source record: 45243

Ever since I plugged a ghetto blaster into my TT's RCA out's, I've been wishing for a way to disconnect the (yucky sounding) internal speaker. I know of the way to turn it off with xcontrol...but when playing auto-boot games which don't allow GEM access, the speaker is defaulted to an ON status. Is there a way to set the default to OFF? Or does anyone know if it would be ok to just hack away inside the case safely and disconnect the speaker (with someway of connecting it again in the future if need be)? Or maybe there is a way to install a switch? Any help (email or posts here) would be GREATLY appreciated. Thanks.

1087. NeoDesk 3.02 and hard disk caches

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-12 07:26:34 UTC
From: genius@sys6626.bison.mb.ca
Message-ID: <Z3NiHB3w164w@sys6626.bison.mb.ca>
Source record: 45244

I recently bought NeoDesk 3.02 and since then I have been annoyed at the fact that NeoDesk (for some reason) ALWAYS reads a directory from the hard disk...even when it should be able to just grab the info from my hard disk cache like NewDesk (3.01) does when I don't use NeoDesk. Does NeoDesk use custom routines to get directories? If NeoDesk used normal GEM-TOS routines, wouldn't it automatically grab the dir info from the cache? I'm using a TT030/4, 135MB internal SCSI HD, CACHE020.PRG (I've since shrunk it from a once CACHE100.PRG...since the cache seems useless in NeoDesk).

From: genius@sys6626.bison.mb.ca
Message-ID: <Z9NiHB4w164w@sys6626.bison.mb.ca>
Source record: 45245

I have a TT030/4 and a 14400bps ZyXEL modem. My TOS is 3.01. Recently I got the supposed fixes for the serial ports HS_FIX and SERPTCH2. I used Serial Patch for a while, but it would still screw up on zmodem uploads for some reason. After receiving HS_FIX, I tried using them both together (which is said to work fine)...my TT freezes up. So I used just HS_FIX, and all my problems went away. My question is, should I be using them together (like I've heard), or does HS_FIX solve ALL the serial problems by itself? Help is much appreciated. Thanks!

Source record: 45240

Haiall !!

I'm interested on a general Monitor Solution too. But the only
Monitor I know you can have for all TT-Resolutions is the EIZO
6500. But the price is *puuuuf* 2999 DM !! Too much !
There is an other from JVC for about 2500 DM but it only has the
data that make him a candidate. Special TT-Connection possibilities
are not known by me.

By the Way: Does anybody know if the OverScan TT works with the
PTC1424 ?? 812 x 496 16 Colors and 412 x 496 256 Colors (or so) looks
fine for 300 DM, doesn't it ??

Ciao
Atarico

The 68070 is/was a Philips chip which is/was a 68010 with serial and
parallel i/o hardware and a small ROM and some RAM onboard. It was primarily
designed as a control processor.

1092. 68020 board

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-12 12:43:23 UTC
From: vince@sci.kun.nl
Message-ID: <1992Mar12.124323.7817@sci.kun.nl>
Source record: 45250

Everybody interested in speeding up his/her ST with a turboboard should go out and buy the March issue of the German ST Computer mag. They test a full range of speeders, ranging from te 16 MHz HyperCache Turbo Plus to a 40MHz 68030 board that outruns a real TT. The 68020 board project from the c't mag is also tested, and it has the advantage of being very cheap (798 DM (about 400$) WITH 68882!) but has NO CACHE RAM, so the figures are a bit disappointing. The Turbo 20 board (with a 68000/25 MHz!) is only 698 DM (that would be about 350$ or so) needs no patched TOS and runs VERY fast.

(Note that this followup is not crossposted to the general newsgroup.
The discussion is basically technical, and the charter of the st.tech
newsgroup discourages crossposting.)

[In article <H.O1xIkAj00n_@jonh.wimsey.bc.ca>,
jhenders@jonh.wimsey.bc.ca (John Henders) writes ...]

> I'm also curious about this. I've been trying to switch from Laser
> to H&S Sozobon, and it seems like dlibs doesn't handle the environment
> the way Laser C did, and running from Gemini, ld can't read the PATH
> variable out of the PATH string passed by Mupfel. Is Dlibs out of date
> on the Xarg standard, or is Laser and Mupfel wrong?

They all pass the environment the same way -- via Pexec(). ARGV adds, to
the end of the environment, an ARGV variable that holds an extended
command-line image. The dLibs startup code pays no attention to ARGV
information. It does understand XARGS, but XARGS has nothing to do with
the environment.

(As I recall, Gemini and Mupfel support both XARGS and ARGV standards.
There's some mystical incantation you can put in your mupfel.mup file that
tells it to use XARGS with any programs you care to define. See the docs
for details.)

If you're having problems with ld, my guess is that you may not have the
LIB environment variable properly set. ld isn't particularly interested in
PATH; that's where you would look for executables, not startup code and
libraries. Check your Mupfel configuration.

If you still have problems, there's a couple of utilities in the Heat and
Serve package that are intended to help diagnose exactly this sort of
ailment. See /sozobon/special/SHOWENV.PRG and /sozobon/special/NAMETRAK.PRG.
The former lists the environment to the console. The latter is a TSR that
lists the result of file searches on your printer.

1094. Tiny Turbo 030

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-12 15:28:19 UTC
From: ec333way@sail.uwaterloo.ca
Message-ID: <1992Mar12.152819.22674@watserv1.waterloo.edu>
Source record: 45242

I just picked up the latest issue of Atari User. Inside, there is an ad from Fast Technologies for their 'tiny turbo 030' upgrade. I don't have the article here, but if anyone wants the complete ad typed up, send e-mail or say so on the net..
Summary: Smallest 68030 upgrade available - seems to say you DON'T need to put your ST into a tower case.. 68030 @40 Mhz, 68000 @ 8 Mhz (for compatibility).. An optional 68882 (the math copro) @ 40 Mhz or so for $299, and a VIRTUAL MEMORY option for $299.. Some of the Specs (from qindex 2.2) seem to say that it's faster than a TT and also another 030 upgrade labelled 'other'... (The higher Qindex scores, the better, right?) It's faster than the other 2 choices in some areas and a slower in others.. BUT, it can do a redraw of a Cad image (w/ fpu) faster than either of the others...
Normally, the price is $999 w/ 68030.. HOWEVER, until April 30 or so, they have a special offer for $599!!!!! From the add it was not clear whether or not this included memory, BUT it DOES include the 68030 @ 40 Mhz..
Oh yeah, comes w/ tos 2.06 (I don't know if they have 2.07, but who knows)

My questions are as follows: Can someone tell what the max mem on this board is?
What is the virtual mem option ? (they claim up to 128 MEG using this)
Is this a viable alternative to the SST? Ie would I 'lock' myself in using this rather than an SST?
Can I still later use Spectre GCR if I have this installed (I don't have spectre at the moment, but might need it later)..

Here's hoping..

From: swood@vela.acs.oakland.edu
Message-ID: <14088@vela.acs.oakland.edu>
Source record: 45247

Has anyone got a program like startgem that will work on the STe?
I used to use some of the startgem spin-offs to start gulam out of the
auto folder, but now that I have upgraded machines, I am no longer able to
do that. If someone has something out there, I would greatly appreciate
getting my hands on it.

1096. Atari UUCP help needed

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-12 16:52:02 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <14089@vela.acs.oakland.edu>
Source record: 45248

What is the best program to get access to a UUCP account from an atari - commercial or otherwise. I have tried using Rodneys UUCP, but I had to modify the login process to handle three steps (which worked fine) but then after logging in, the thing seemed to be sharing incorrect protocol with my host system. I have also gotten ahold of Hermes, but it seems still limited to two step logins, and I have no idea where to get English docs and/or a German translator.

If anyone could either point me to a good program, give me an idea what the protocol exchange for a UUCP connection initialization or help me get my Mercury (Hermes) package up and going, I would greatly appreciate it.

BTW: My login process here is going to consist of at least three steps (not just two)

Local: connect vela

Vela Ultrix system

login: Utre
Password:

... so please keep this in mind

>or ec333way@sail.uwaterloo.ca

Don't have either one, but from the past informations and the ADs, the tiny turbo 030 does not have any memory except a small cache memory. The benchmark look great, but need to keep in mind the real world application might not be like what quick index show, especially if the program you interested is a huge program that likes a lot of memory.

The virture memory option probably just some page memory management stuffs that use your hard drive as the memory and swapping pages in/out of the hard drive and make your software think there is upto 128MB of memory availible to it.

As compare to SST, for $599 and not needing the extra like the larger real memory, math coprocessor, it would be a good one. Also the small size would mean no need to move ST board to PC case. But if you want more memory and the 882, then should consider those price into the comparism.

Personally, I would get the SST for the fact it has 8 SIMMs and an expansion port, plus knowing it's going to work with GCR (afterall it's from same developer, Mr. Small). However, Tiny 030 would fit for user who don't want to move the motherboard nor care about the extra memory.

Would be nice if user of both board would give us a quick review and some real application timing insteaded of the quick index number.

Hermes and Mercury are pretty well it, thought the Citadel BBS
system also works. I think you're main problem would be with uucico. You
might want to change the version that came with Mercury for the 3.21
version. Also check with your admin to see what protocal his uucico uses.
Hermes isn't that different than Mercury, except for changes to the
XHOSTS file, which is where the login strings would live. I don't know
if uucico supports more than two strings but the author is
E-Mail: jan@janhh.hanse.de
so he'd be the person to ask. Hermes is well worth the money asked for
shareware, and I've found the author to be reasonably prompt answering
questions and fixing problems. English docs are promised.

PD>But I'd rather recommend the use of AMCGDOS or NVDI. Both of them are
PD>much
PD>faster and less buggy.

This is also a good idea. But the bug Dave noticed with GDOS from Atari is not GDOS's fault but ours.
We have included the Gemini fonts in motorola format which was never officially supportet by Ataris GDOS. We never noticed this because we never use the Atari GDOS. It's terribly slow. AMCGDOS is much better and I recommend it.
Nevertheless: all fonts will be in Intel format in the unforeseeable future...

High Speed Pascal (in Germany Maxon Pascal) was advertised as Turbo-Pascal-compatible (almost), and that's why I bought it. However, when I tried it on several TP sources, I realized that it couldn't even do the following:

```
const A = 10;
B = A+2; !!!!
```

or:

```
var x: array [1..1+1000] of integer; !!!!
"""""""
```

It obviously can't (pre-)process constants!!

But it also has some advantages: short code, assembler support.
It doesn't have many compiler-options though (no line-f FPU support, no > 68000 code...)

Marinos.

Have you remove the drive terminating resistors, a ceramic pack,
the Atari can't drive these low terminating resistors usualy 330 ohms,
there is also a fixed resistor R40 that has to be removed..

Also set the jumpers to 720k mode..

Let me know if this helps..!!!

1112. HP Deskpro 500 on the ST, and/or FSM GDOS?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-13 16:39:00 UTC
From: pjc@jet.uk
Message-ID: <1992Mar13.163900.11604@jet.uk>
Source record: 45267

OK, this is a portmanteau question.
1) The HP Deskpro 500 inkjet printer is, according to the various
PC mags, cheap, reliable, fast and gives near laser quality. Is there a
GDOS printer driver available for this beast? What does it take to use it
with the ST, using 1st Word Plus or other word processors (non - GDOS)
1a) Ditto for the colour version. Also, what other drivers are available
for it, with the various paint and draw applications.

2) I hear that the FSM GDOS is now released in the US. When does it get to
the UK? Is it available separately, or only bundled with other applications?
Is it compatible with existing printer drivers? [reveals his deep ignorance
of the workings of GDOS printer drivers here] Oh yes, how much does it cost?

>posts here) would be GREATLY appreciated. Thanks.

Typically (I haven't looked inside a TT) PC-style speakers are connected to
the motherboard by a simple two-pin connector, easily removed. You could
simply unplug this, or even if it's hardwired you can snip one of the wires
going to the speaker and insert a simple SPST switch (Radio Shack will have a
variety of these). Note that doing this (even opening your case, probably)
will void your warranty and perhaps result in global destruction, so I accept
no responsibility.

I also bought a MEGA STe and experienced this problem. Just before my
guarantee expired I went to my dealer and had the chip changed. It did not
really solve the problem, but the described flip which occured almost
everytime with the old chip now occurs very seldom, so I can live with it.

This flipping of the screen occurs when you write on address $FF820 (well,
I'm not really sure about this; maybe I should look it up at home :-).

1117. ZOO bug ?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-14 03:48:19 UTC
From: ljdickey@watmath.waterloo.edu
Message-ID: <1992Mar14.034819.8505@watmath.waterloo.edu>
Source record: 45268

Hello.

I think I have uncovered a bug in zoo.

I have done steps like these several and they seem to give
with similar nasty results each time.

Here is an edited (but faithful) reconstruction of what I did.

```
1 % echo hi > hi
2 % arc a hi.arc hi
3 % mv hi.arc hi.zoo
4 % ls -t hi.zoo
-rw------- 1 u 35 Mar 13 20:40 hi.zoo
5 % arc v hi.zoo
Name Length Stowage SF Size now Date Time CRC
============ ======== ======== ==== ======== ========= ====== ====
HI 4 -- 0% 4 13 Mar 92 8:49p EB48
==== ======== ==== ========
Total 1 4 0% 4
6 % ls -t hi.zoo
-rw------- 1 u 35 Mar 13 20:40 hi.zoo
7 % zoo -t hi.zoo
Zoo: WARNING: Archive header failed consistency check.
Zoo: FATAL: Invalid or corrupted archive.
8 % ls -t hi.zoo
-rw------- 1 u 1259 Mar 13 20:40 hi.zoo
```

My big question is this:
Why does ZOO change the file!
It seems to be step 7 that is doing it.
You might think my sequence was perverse, but there is method to this madness.
I discovered this behavior when working with a larger file of
unknown origin, and I simply wanted to know if the file was a zoo file.
I thought that if I renamed it JUNK.ZOO and then did a test of the file,
I would find out whether or not it was infact a .ZOO file.
In doing steps a lot like the above, I created a monster that
filled my disk. YIKES!

Right now I suspect ZOO of having corrupted a partition of my hard drive
by creating files with crossed links in another partition. Any comments
or suggestions welcome.

>Anyone know what I am doing wrong??
>

Pinhead is a very stable application, so I would assume it has something to
do with something executing before Pinhead (or the thing which executes right
after it). I have pinhead as the second auto folder program (the first is
fatspeed), and have never had a problem. I would put it early in the boot
sequence (it would be useless to put it near the end), and see what happens.
It is possible that the program right after Pinhead is depending on clean
memory, in which case you can tell pinhead to leave it alone (there is a
config file facility).

1120. 4-byte boundary

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-14 13:30:52 UTC
From: stigvi@Lise.Unit.NO
Message-ID: <1992Mar14.133052.23007@ugle.unit.no>
Source record: 45271

I have just compiled spice2g6 with f2c and gnu c. Spice works fine as long as it is loaded on a 4-byte boundary address (address/4 => no remainder), but complains heavily if not.
Does someone know how I can solve this problem. Should I make a loader which places the code on a 4-byte boundary or are there any ways to instruct gnu c to place code and data on 4-byte boundaries. Are there any modifications in the assembly output from the compiler I can do or anything else?

Stig Vidar Hovland - stigvi@lise.unit.no

1122. Making default buttons

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-15 03:20:41 UTC
From: saj@chinet.chi.il.us
Message-ID: <1992Mar15.032041.22648@chinet.chi.il.us>
Source record: 45143

I have a simple little form with 2 non-editable strings and 2 buttons in a program. I want to select which button will be the default just before drawing the form. I set the DEFAULT flag in the ob_flags field of each button object, and sure enough, the correct one is drawn with a thickened border. And I can select one or the other with the mouse alright. But pressing the RETURN key does nothing. Other possibly significant things are TOS 1.2, Mark Williams C and that the outlines of the buttons have been enlarged a fair amount. Resource built with Atari's RCS.

Does this strike anyone? Is it something obvious? I'd like it to work right, but it isn't worth tracing all through ROM code for.

One possible key (??): there are no editable text objects in this form.
Steve saj@chinet.chi.il.us

1123. Help - 1040ST memory upgrade

O.K., I finally got enough desk accessories and needed a large
enough RAM disk so that I'm starting to get "out of memory" errors from
my 1.0 Meg 1040ST. I went down to my local retailer and asked about
upgrading to 2.0 Meg. He said I would need a $139 upgrade board, *AND*
that the memory on the motherboard would be invalidated by the addition
of the piggyback board - so I would need 2 SIMMs at $50 each.

Does this seem right? Isn't there a cheaper way?

I do 2.5 meg memory upgrades for people here, I do not use any Plug in upgrades,
to me they are all rubish, I use SIMM soldered and mounted to the main PCB,
I only charge $350nz for this, the Atari dealers here charge $350nz
for just a 1/2 meg upgrade..

SIMM's cost about the same here..

k>High Speed Pascal (in Germany Maxon Pascal) was advertised as Turbo-Pascal-
k>compatible (almost), and that's why I bought it. However, when I tried it
k>on several TP sources, I realized that it couldn't even do the following:

In a few months there will be a new competitor in the Atari Pascal market. On
the CeBit fair in Hannover ASH was showing Pure Pascal (from the makers of Pure
C (Turbo C/ST) as far as I understood).

Pure Pascal is said to be Turbo Pascal 6.0 compatible (so with OOP!) and comes
with a Source Level Debugger. The price was said around 350-400DM (~210-250US$)

Seems to be an alternative to Maxon Pascal, even though the said that there are
some restrictions. Instead of the GUIlib/-bindings (forgot the name) from TP
6.0 there is a GEMlib and MS-DOS/Intel dependent Features are (understandable)
missing.

Source record: 45280

I've just finished soldering a TOS Extension Card with TOS 2.06 into a 520ST. While everything seems to work as it should, the mechanics of it don't inspire confidence. The wire delivered looks like the kind that breaks very easily when bent; it is bent now. Also, I haven't been able to close the case yet - the card with the insulating pads is just too thick. The (bent) flat cable doesn't help.

Does anyone have ideas for this setup, that is, TEC and a keyboard-case ST? Single-strand wire would take up much less space, but redoing the 50 wires wouldn't be fun...

If you want ease of use and you have lots of memory for both RAM and disk, then use CS-TEX.

If you are limited on RAM and disk space then get the generic TeX 3.1. No official documentation exists. I wrote a preliminary draft of the installation guide to this software. It has some errors that I have found and corrected. I was close to posting the second revision when I had a major system failure which erase all of my hard disk and ruined my ST power supply. While I make regular backups, I had not backed up the revision to the document before the failure. Since I have to spend my next week doing taxes, I think I'll get the revisions retyped next Tuesday.

So for this infinate delay. If the net wants it, I'll resend my first draft out with a disclaimer about the warnings.

In article <yQ.VtZvlrsA@bara.uucp> wr@bara.uucp (Wolfram Roesler) writes:

>it seems that AES applications do busy waiting when using evnt_multi
>calls under MiNT... other processes (e.g. top running on a terminal)
>seem to get no cpu time while the application is waiting for an event.

This is because the current AES runs in supervisor mode and MiNT doesn't do
any taskswitches while the CPU runs in that mode. Most GEM applications
almost only run in AES during their main event loop ...

>Could it help to write an acc that executes Syield every time it
>gets control via AES?

Yes, exactly. Since from MiNT's point of view accessories are part of the
GEM process, this gives MiNT the opportunity to switch tasks while the AES
is running. You can do this by installing a small accessory like the one
below (which is written with Turbo-C).

Stephan.

```
/*************************************************************************/
#include <aes.h>
#include <tos.h>
#include <mintbind.h>

#define INTERVAL 40 /* approx. Syield() interval in ms */

typedef struct
{
long tag;
long value;
} COOKIE;

void main(void)
{
void *ssp;
COOKIE *jar;
int msg_buf[8];

appl_init();

ssp = (void *)Super(0L);
jar = *((COOKIE **) 0x5a0L); /* fetch cookie jar pointer */
Super(ssp);

if (jar) { /* first see if MiNT is installed */
while(jar->tag) {
if (jar->tag == (long)'MiNT')
```

```
for(;;) { /* MiNT cookie found --> enter event loop */
evnt_timer(INTERVAL, 0);
Syield(); /* let MiNT do a taskswitch */
}
jar++; /* else inspect next cookie */
}
} /* MiNT not installed */
for (;;) /* accessories must not terminate ... */
evnt_mesag(msg_buf);
}
```

From: brownbir@p4.cs.man.ac.uk
Message-ID: <brownbir.700737873@p4.cs.man.ac.uk>
Source record: 45151

I have just aquired a monitor of unknown origin and it want to connect
it to my atari. It has a power supply lead.. which is no problem and
5 wires for signals. One is black and is connected to ground the others
are pink, brown, white and yellow.
How do they relate to the signals from the atari. I asssume I am going to
need to connect v-sync and h-sync , but which others...???
Guesses are welcome......they may be right!!!!

Matt

NB this is quite important I get it fixed for my final year project!!!

disclaimer- "I know nothing"-Manuel

-> In Germany, there's no problem to get the 68010 - 64pin format!

You're lucky. In France it's quite impossible, and a 010 is more expensive
than a 020 at the same frequency !!!! I have an old 68010 somewhere in my
mess, never used it.

-> Not this one. New TOSes are able to patch programs at runtime that try to
-> invoke move sr,... in user mode.

Yes but under TOS 2.00 the patch is buggy, and really does nothing but mess.
(I speak of French TOS, may be different on others, though would be surprising)

Enjoy.

For Tech freaks like me..

One thing that I have noticed the NEC FD1037A has a unusual head stepping
motor, well its a thin flat linear motor, its in the base and the heads
just sit on it.

Move the head in to the center and you can see it, the
heads run on small rails that are part of this motor..

I had the same problem with a program of mine, and my conclusion was that
the only way to solve the problem is, indeed, a loader that makes sure the
program is read to an n-byte boundary (n=4 for you).

Saying `align n' or something similar in an assembler will make *no* difference
at all. The TOS loader will read the program to an even address; there's
no way to force a stricter alignment.

Jens Kilian.

yeah, that is not surprising because what atari supplied (to
developers anyways) was totally wrong and confusing. Michal Jaegermann
figured most of this out. i am enclosing the gcc bindings for bez's
and a example program. hope that will clear up things:

GCC bindings:

```
/*
* vdibez.c
*
* Bindings for Bezier curves.
*
* ++jrb bammi@cadence.com
* and Michal Jaegermann, ntomczak@vm.ucs.ulberta.ca
*
* Some function have alias names in order to maintain a common
* set of symbols with compilers which need symbols unique in the
* first seven characters. Besides this resolution is required
* by "The Standard" :-)
*/

1144. soundchip plus sample on ST

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-16 17:37:17 UTC
From: paul@kagaku.se.fujitsu.co.jp
Message-ID: <PAUL.92Mar16173717@nsx.kagaku.se.fujitsu.co.jp>
Source record: 45290

Does anyone know if the game, Turrican II has 3-channel soundchip plus digi-drums on normal STs? I have an STE so I wonder if it sounds the same on the ST. On the STE, it's easy to mix samples with soundchip music since the STE has two soundchips. On the ST though, any sample routines I've seen use all of the Y2149s channels to approximate an 8-bit linear scale, therefore, I don't see how it would be possible to mix digi-music and soundchip on normal STs. Incidently, the added digi-drums sound pretty good, don't they?

>of the READMEs.

The CS version is also available at atari.archive, and it is MiNT-aware.

> And in a German mag I read that there is a MultiTeX
>version, which is a CSTeX especially for MultiGEM. But this is _NOT_
>freeware, and besides, I don't have MultiGEM.

This isn't quite correct, the new MultiTeX is simply an enhaced and improved version
of CS-TeX with a better shll, MF preview and some other goodies.

But the name is misleading, and the article in the magazine is full of mistakes.

> Instead, I use MiNT and
>MW2 (for the time being; I'm writing my own windowmanager) and I guess
>there are a lot of people with this setup. So: which TeX feels itself
>good in this environment?

You will like CS-TeX. Try it and let us know what you think. The CS-TeX that is available
for ftp is free and will be supported by CS as well as MultiTeX.

Current CD-I players (Philips) use the 68070. New players are generally expected to use the 68340, a 68020-core with additional timer/DMA/serial functions on-board. There's no inherent requirement that CD-I use those chips, though - theoretically any 68xxx-based hardware could serve as the basis for CD-I.

1148. Spectrum 512 and Palette switching

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-16 19:39:10 UTC
From: plate@cdsmn.mn.org
Message-ID: <1992Mar16.193910.25524@cdsmn.mn.org>
Source record: 45146

Does anyone know how a Spectrum 512 viewer switches palettes during a scan line: Specifically, at what point (xposition) does the palette switch and what triggers it (an interrupt?). I have been reading the PICFMTS.DOC from a.a. and the source code sample under the Spectrum512 section has me confused. It doesn't return values that I expected and I wonder is there a typo in the code or am I missing something? Steve Belczyk, are you out here?

Here's the code, pulled right from the doc file:

```
*-------------------------------------------------------------------------*
Given an x-coordinate (from 0 to 319) and a color index (from 0 to 15),
the following C function will return the proper index into the Spectrum
palette (from 0 to 47):

/*
* Given an x-coordinate and a color index, returns the corresponding
* Spectrum palette index.
*
* by Steve Belczyk; placed in the public domain December, 1990.
*/
int
FindIndex(x, c)
int x, c;
{
int x1;

x1 = 10 * c;

if (1 & c) /* If c is odd */
x1 = x1 - 5;
else /* If c is even */
x1 = x1 + 1;

if (x >= x1 && x < x1 + 160)
c = c + 16;
else if (x >= x1 + 160)
c = c + 32;

return c;
}
*-------------------------------------------------------------------------*
Thanks,

Could someone tell me if I am alone in the world of trying to use uucp on the ST?

I have been trying to set up the "Mercury UUCP package" on a 1040f, and it does work. But, when I poll the local news system, the program writes to the hard drive and wipesout itself!

I garbles the directories that the news, and mail is stored in. And I cannot delete those dirs once this happens. I have to zero the partition each time.

I would like a SHELL/CLI that is dialup, anyone havew any ideas?

1150. AHDI Compatible Driver in C

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-16 22:47:47 UTC
From: ted@tedux.hobby.nl
Message-ID: <1992Mar16.224747.733@tedux.hobby.nl>
Source record: 45160

Hallo *,

A few years ago i wrote an AHDI compatible driver for my SH204 harddisk
in C. The driver supported 8 controllers and 2 drives/controller. I wanted
to post the driver and sources in comp.sources.atari.st but it never got
there for various reasons.

Now i want to post the driver sources but they are bit old. They need updating
to the new partition structure etc. to make it once again compatible with
the latest AHDI version. I think the latest is 3.X. Mine is V1.7 compatible.

So what i wanted to ask if there is someone out there who wants to take over
my driver sources and update them to the latest state of the art and then
post them in comp.sources.atari.st.

The reason why i ask for someone else to update the driver is simple. I do not
own an Atari ST anymore.

If you think you can do this job and know something about DMA, SCSI and
hardisk partitioning please respond by email to: ted@tedux.hobby.nl or in
bang: sun4nl!hgatenl!tedux!ted.

PS. Please do not ask for the sources because you need them for some kind
of a project. They will be posted. Updated or not.

>Thanks.

Ha hah haahahhahaaaa haha ha ha ha ha haaaaaha hahaha hahah ahahhah ha,
hah ahhaaaahhahahhah ahhaha hah ha ha ha ha haha hahahahhahahahaahaaaha,
hahahaaaahaahahahaa ha.

Sorry, cracked me up there...

There is NO WAY of making the physical world move faster with software. When
you get the volume label, the disk HAS to start spinning (or the head HAS to
move if you're on a HD). That's what takes the time. You may be able to
make it work faster, but C and ASM differences wont help more than a 0.01%
speed up (air figure).

Best answer is to have disk caches installed, though that's pretty useless
on a floppy system when disks are changed.

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <55949@cup.portal.com>
Source record: 45153

Paul Donnelly asked about games which used both sampled sound and the three voice sound chip on non STe systems...

The game "Llamatron" from the U.K. uses both digitized sampled sound and Yamaha sound chip sound effects, and sounds just great on my plain-vanilla 520ST. The trick must be to avoid doing both at the same time.

The game "Revenge of the Mutant Camels", from the same programmer is available in several different versions for STs, STes, and TTs... I don't know if the sound is different in the various versions... the documentation seemed to indicate that the major difference was in the smoothness of the graphics.

Do I understanfd it right that you marked two buttons as default?
I think that this does not work, there can be only one default button
in a dialog(I think). Try to clear the default bit in the other button's
ob_flag field, that should work.

Message-ID: <1992Mar17.143207.28313@cs.mcgill.ca>
Source record: 45157

Well, if the RCS seems to be a real headache, why don't you try to code object trees by hand (I do it, honest. And it is very easy, and allows me to make the program modify it quickly.)

Here is the format :

W : index of next item on same level
W : index of first child item
W : index of last child item
W : object type
W : object attributes (Selectable, Lastob, etc ...)
W : object status (Selected, disabled, etc ...)
L : See later for details
W : object x coordinate (Relative to object above)
W : " y " " " " " " "
W : object width
W : object height

about the L:

if it is a G_BOX, G_BOXCHAR, G_IBOX
high word
high byte : Character ASCII code for G_BOXCHAR
low byte : width of border (0 = no border
- = border toward outside
+ = border toward inside)
low word :
color coding :
bits : 15-12 : color of lines (For borders)
bits : 11-8 : color of text
bits : 7 : 0 = no fill, 1 = fill
bits : 6-4 : density of fill. 7 if full fill
bits : 3-0 : color of fill

for all other types :

pointer to the info structure (More on that on a later posting, as I do not have them near me) or pointer to the string (For G_BUTTON, G_STRING, G_TITLE)

See, it aint that bad...

1159. transferring floppies between an ST and a SPARCstation

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-17 16:11:23 UTC
From: georgew@tekig1.PEN.TEK.COM
Message-ID: <4800@tekig7.PEN.TEK.COM>
Source record: 45159

This is more a curiosity question than a "must know" question.
In the past, I've always been able to format floppies with my ancient
version of DCFORMAT, adding the MSDOS boot sector, and then taking it
to a PC or vice versa. I now have a SPARCstation at work, and I
discover it can only mount the floppy if it was formatted on the
SPARC (I use fdformat -l -d -v). Obviously, I can just format floppies
on the SPARC, but I wondered if anybody else had experienced this.

Thanks

1161. new versions of tcsh and mntlib

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-17 21:45:07 UTC
From: 7103_2622@uwovax.uwo.ca
Message-ID: <1992Mar17.164508.1042@uwovax.uwo.ca>
Source record: 45162
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've uploaded new versions of tcsh and mntlib to atari.archive.umich.edu.
See mint/tcsh.zoo and mint/mnt{inc,lib,olb}19.zoo.

This version of tcsh works correctly in windows, and doesn't choke on
files with carriage returns in them (the latter bug was causing all kinds
of weird symptoms and took me a long time to track down!). Again, it's
been tested only under MiNT, but probably works OK under TOS as long
as you don't do anything fancy (pipes are considered "fancy" here).

The new version of the MiNT library contains support for Sozobon 1.33i and
2.00, courtesy of Dave Gymer. There are also lots of bug fixes, and
some support for new features that will be available in MiNT 0.93.

I tried VAULT and indeed, it is quite speedy, compared to every other method I have seen. Maybe TURTLE is as fast, but I have not done comparison timings. Both copy files to a ramdisk installed by the backup software, and then copy to floppy.

I have no problems on my Sparc IPC at work. However, I also have a
machine with TOS 2.05...IE Mega STE. Formatting/reading/writing on my machine
I have no problems.

I had an old DDDS drive that was out of alignment that gave my similair
problems a long time ago, as the format was not up to spec and the Sparc
I was working on would give a can't mount disk error with dosload. Only if
I formatted the disk on the Sparc would my St be able to read it.

1166. Monitor problem.

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-18 07:41:47 UTC
From: d9fors@dtek.chalmers.se
Message-ID: <10214@chalmers.se>
Source record: 45172

I have a SM124 monochrome monitor (New model with SM124 in blue letters)
My problem is that after a while (1-3 hours) the monitor will start to "buzz"
and the screen flickers so much that it's totally useless.
If I turn it off the screen will lokk perfect just before the power is cut.
Turning it on just afterwards will give me a normal screen again but it will
not hold for long.
It looks to me as if it is some kind of overheating problem but I'm not sure
and I am wondering if anyone else has had any similar problems.

/Patrick

>
For the european netters:
These new versions are now also available from archive.cs.ruu.nl.

We, Computer Science department, Utrecht University, are running an
anonymous FTP server on one of our systems. In addition to the FTP
service we're also running a mail server, for those of you without
direct Internet access.

--> How to get the new versions via anonymous FTP:

Site: archive.cs.ruu.nl [131.211.80.5]
Login: "anonymous" or "ftp"
Password: your own email address (you@your_domain)
File: ATARI-ST/cli/tcsh.zoo
ATARI-ST/mint/mntinc19.zoo
ATARI-ST/mint/mntlib19.zoo
ATARI-ST/mint/mntolb19.zoo

--> How to get the new versions via e-mail from our mail-server:

NOTE: In the following I have assumed that your mail address is
"fred_flintstone@stone.age.edu"; of course you must substitute
your own address for this.
** PLEASE USE VALID DOMAIN ADDRESSES. DO NOT USE ADDRESSES **
** WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET **

Send the following message to
mail-server@cs.ruu.nl
or the old-fashioned path alternative
uunet!mcsun!hp4nl!ruuinf!mail-server

begin
path fred_flintstone@stone.age.edu (SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/cli/tcsh.zoo
send ATARI-ST/mint/mntinc19.zoo
send ATARI-ST/mint/mntlib19.zoo
send ATARI-ST/mint/mntolb19.zoo
end

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:

send HELP

A complete "ls-lR" listing of the archive is kept in the top-level directory, it will be updated every night. To get it, issue the command:

send ls-lR.Z

That's all for now. If you encounter problems using the FTP service and/or the mail-server, feel free to drop me a line (by e-mail, please).

1168. Re: AES evnt_multi with MiNT: Busy waiting?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-18 12:06:37 UTC
From: jensk@hpbbrd.bbn.hp.com
Message-ID: <9130005@hpbbrd.bbn.hp.com>
Source record: 45185

Not exactly related to the theme of this thread, but of a similar nature:

When browsing through the MW source code, I noticed that MW also constantly
burns CPU time. It listens for AES events, including the timer event, and
only when a timer event happens (with no other AES events thrown in) does
it condescend to Fselect() the pipes to the processes it manages.

After some heavy thinking (`*Why* does Alan Pratt do such a thing'), I came
to a rather depressing conclusion. Since MiNT knows nothing of AES, and AES
nothing of MiNT, I can see no way to wait for either an AES event or a
file descriptor getting ready for IO *at the same time*.

Let's hope that Atari does this right in MultiTOS (though knowing Atari,
I wouldn't bet on it ...)

From: vicb@clark.edu
Message-ID: <1992Mar18.122116.168@clark.edu>
Source record: 45171
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Greetings...

Anybody have any idea as to what I can do to get a good printer dump on
my new STe?
I have been using a DEGAS driver (prtinstl.lzh on a.a.u.e) with the EPSON.PRT
info file (yes, it's been renamed DEGAS.PRT) on my 520ST for some time
now with excellent results, but on the STe it just gives a really small
output (takes up a quarter sheet of paper.)
I also tried hc24_hc12.lzh (or is it hc12_h24.lzh?) which works on the ST
but it puts out garbage on the STe.
The printer supports Epson LQ800 emulation, the system is a 520STe with
2 meg RAM with CACHEXXX.PRG running, no hard drive.
Any help would be appreciated. Thanks.

Victor Bruhn

You should always have SETUP.PRG first in your AUTO-folder. It's a tiny program that does some configuration (sync setting etc.) and it also runs a file called COMMAND.TOS when you hold down the Control-key at boot time, so it's quite useful in such cases - you can use any CLI as COMMAND.TOS to delete or rename programs in the AUTO-folder that won't work. I think I found this program in the TURBOASS-package, but I'm not sure. Source is included, if you want it, email me...

Would you happen to know if they take back other Pascal compilers (such as my
Maxon Pascal?) as they did with Pure C? I'm not sure whether they only
took Lattice C and Turbo C packages back (which were distributed by them I
believe) or other ones too...

Yes, you can use the "set attribute" GEMDOS function to do this (don't know the official name, since I'm typing this at work). I believe the problem is to _reset_ it. That's when you use a disk editor 8-).
Cheers,

Leo.

>

Yeah, I have problems similar to this (not exactly the same, but similar) ...
When I switch my monitor on, the screen goes completely white, then starts
to flicker rapidly. As the monitor `warms up' the flickering slows down until
you have a steady picture superimposed with white diagonal lines, which will
fade after about half-an-hour.

The question is, are such problems fixable by someone with a basic knowledge
of electronics (ie. myself) or am I going to have to send my monitor back to
whoever I bought it from (it's still under warranty y'see)

Any help would be greatly appreciated.

Simon.

1174. Need info on Floppy drive

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-18 20:36:43 UTC
From: b41987@shylock.ctd.anl.gov
Message-ID: <1992Mar18.203643.23815@mcs.anl.gov>
Source record: 45178

Hi,
I have recently resurected my ST. The problem is that a while back(some 2 years) my original floppy drive got destroyed. The replacement is from an old Amiga. Everything works fine exept the media change doesn't get recognized. This is an internal drive on a 1040stf. I know that to get it working I need to connect the write_protect detect and media_change detect. What are the pin numbers of these lines on a back of the drive.

Thanx for any info,
Michail Gomberg
b41987@achilles.ctd.anl.gov

The atari archives at UofM have it. I don't know if it still works
but you used to send mail to atari@atari.archive.umich.edu
with 'help' in the message body, and it would tell you all about itself.

If it doesn't work, wustl archives might be the next stop.

>
>>Date: 1 Nov 89 19:18:30 GMT
>>From: imagen!atari!kbad@ucbvax.Berkeley.EDU (Ken Badertscher)
>>Subject: GEMDOS Extended Argument Spec (LONG)

The Mark-Williams-C-Compiler had the same specifications as the Atari-proposal, that's: - handle 2 points to the console as stderr-device
- the last variable in the environment is ARGV
- it's value is a vector of characters describing the state of various handles (pointing to a file (F), the console (C), the printer (P) or the serial port (A)) - unknown handles had assigned a '?'
- following are the programs name and all arguments separated by NUL-characters
The Atari-proposal was changed at two places:
- the value of ARGV is ignored (so the MWC-value would conform)
- the length-byte of the command tail in the basepage is set to 127, a value which could not occur if the program is invoked from the desktop
By disassembling the startup-code of several MWC-Tools (including the passes of the compiler), we gained the information that Mark-Williams used a value of 127 (as specified in the later Atari-standard) as a validation check for their own programs although not in their libraries. Just look at their code and you will see this!
I don't want to repeat the discussion about the problems of the several methods (xArg is passed in the parents address space, MWC has no validation, Atari-ARGV breaks any Pascal-programs relying on the Pascal-string semantic of the tail in the basepage,...).

*** --- ***
The important point of my posting was, that there is more than one shell using an extended argument-passing scheme and that Master does not force the user to use one particular method.
*** --- ***

BTW: Are there any programs (shells aside) using the FULL Atari standard ?

In the gcclibs/mintlibs there is a compilation switch to get this behavior (STRICTLY_COMPATIBLE_WITH_STANDARD), but this switch is DISABLED by default (i think for good reasons - an extension should add some new feature and not break programs not using this feature, for example old ones).

I think this is true, having recently written some code to read volume labels.
You need to do the usual search through the directory, checking for the
appropriate file type.

1179. harddrive directory woes

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-19 07:25:25 UTC
From: thaanuj@prism.CS.ORST.EDU
Message-ID: <1992Mar19.072525.3953@CS.ORST.EDU>
Source record: 45181

Well, I had just ftp'd dmj-gif (sp? the gif --> Spectrum program) from atari.archive, and was in the middle of testing it out when I received some scary errors. I was trying to move a .spc file from d: to e: on the regular GEM desktop, when I got a 'device does not exist' alert box. I power-cycled and rebooted, and all the files that used to be on e: now show up in the d: window. The executables even run if I double-click on them, even though they are apparently in the wrong directory.

I can't find a way to access any of the files that used to be on d:, but I had all my FSM-GDOS files on d:, and they seem to be available during the boot-up process, since I see the familiar message about FSM having been successfully installed.

I don't know much about how partition/directory/FAT info is stored, but is there a way I can retrieve the files from d: ? Nothing I can think to try has worked.

My setup: Old 520ST w/2.5 meg RAM. TOS 1.4. Syquest 44meg removeable using ICD Advantage+ host adapter and ICD software.

I have seen you geniuses out there answer a lot of tough questions, so maybe you can help me, too.

Any suggestions heartily appreciated,

|> Mail me, or answer here or ...

Problem fixed, thanks to all who helped.

This is what I did, in case anyone has a similar problem.

1. Start the HD,let it spin up.
2. Turn on the ST, holding down ALT. This makes the ST
boot up without running any AUTO-progs, etc.
3. Run AHDI.PRG from the floppy, install a C-disk.
4. Rename/remove the offending AUTO-prog.

Suggestions has been mad about running something like
SETUP.PRG as the first AUTO-prog, to be able to decide
which AUTO-progs should be run at boot up. I don't want
to do that since that means sitting there waiting for the
ST to boot, which seems like no great thrill to me.

Thanks all, again.

You will have to lose at least 512K on the main board winding
up with a 2.5 Meg machine. Not all memory expansions use SIMMS.
Zubair's board can be got for around $100 now. If you remove all
mother board chips you can go to 4 meg.

>(Besides reformatting the HD, that is.) Some of the other AUTO-progs
>that run before the perpetrator (Eternal.prg, etc) seems to run OK.

Before attempting to reformat the hard drive, boot from a floppy, then run your hard drive's driver from the floppy you should have gotten when you got the hard drive. Then install the C: icon, open it up, and rename the offending program so that it is no longer recognized as an executable (.PRG -> .PRX for example). Assuming the problem was with that program, you should then be able to again from your hard drive.

If you continue to have problems with other AUTO run programs, or accessories, your hard drive may be going bad. This just happened to me. =(

1184. Spectre GCR

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-19 15:53:59 UTC
From: heidelj@alleg.edu
Message-ID: <1992Mar19.155359.4090@pellns.alleg.edu>
Source record: 45188

Help!!!! I just tried installing Spectre GCR on to my last partition on my hard drive which had/has nothing on it. I formatted the last partition to GCR format, the computer rebooted and now I can't access anything on my hard drive though I know it is still there. I loaded Spectre back up to tried and look at the format menu. It still knows that I have all of the partitions but I can't access it. Is there any way to reformat the last partition back to ST format and how can I access the HD again?

Thanks,
Jason Heideloff

I have similar problems with it, but mine occur when I try to uuto a file to
my ST. It gets here, but as a strange file name.

Are the sources available anywhere? I would be glad to fix up that portion.
I do NOT have access to FTP.

Charles Johnson's shareware Desk Manager can be set
to only run if you press a key during boot up. Or, wait 1
to 30 seconds before bypassing. Also you can assign different
setups to funtion keys.
I wouldn't run a hard drive without it.

1189. Internal floppy disk woes.

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-20 10:40:56 UTC
From: robin@castle.ed.ac.uk
Message-ID: <19334@castle.ed.ac.uk>
Source record: 45094

My internal floppy on my 520STFM is dying, I want to know can it be easily fixed?

The symptoms:--

Works normally for a short while and then grinds to a halt. Sometimes it sounds like it is spinning a lot faster than normal.

I opened up the case and had a look at it running, the motor seems to stick, when this happened I rotated the motor by hand and I heard what sounded like the protective shield on the floppy disk being opened.

I tried to install a 3 1/2 inch drive that I scrounged from a PC, this seemed to spin normally and I tested it on a disk, it read the directory structure fine but when I tried to change directory it just kept spinning without finding any files, there are some jumpers on this disk drive but I have no information what they set up.

Any help would be gratefully welcomed.

What do you mean by 'waiting for the ST to boot' ?
SETUP.PRG does not change anything in the ST's behaviour at bootup unless you hold down the Control-key, in which case it loads a CLI so you can rename/delete corrupt programs from the auto folder...

^^^^^^^^^^^^^^^^^^

This problem was solved some time ago. There are boards now containing
2 Megs and a smart GAL which hooks the two .5M banks together, thus
yielding the full 3 MB. These boards are quite cheap also (about 300DM)
but require quite a bit of soldering.

>up with a 2.5 Meg machine. Not all memory expansions use SIMMS.

1192. MIPS/FLOPS rating Atari computers

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-20 12:30:36 UTC
From: vince@sci.kun.nl
Message-ID: <1992Mar20.123036.11137@sci.kun.nl>
Source record: 45099

Does anybody know the MIPS / FLOPS rating for the Atari ST and TT?
I only know the ST runs at about 0.075 MFLOPS (auch!) but the TT, with
its 68882, would probably have quite an impressive number.
I am hoping the figures won't look ridiculous next to the awesome 13
MIPS the new Acorn A5000 slithers through its windows with.

Hello,

I own : atari 520 ST with external one-side floppy drive.
I need : loading a big program (maybe more than one one-sidedfloppy) and executing it, needing more than 1 Mb.
I heard: I can buy 1 Mb harddisk for about $100 and I can buy another drive (double sided) for about $200.
I got: problems.. because I don't want to spent too much money.
I ask: Can I handle it with only buying the 1 Mb and archive the program? Other solutions?
Ik vraag ook: heeft iemand omgeving Amsterdam 2e hands oplossingen?
(That was a dutch question :-)

please, reply by email to bert@cs.vu.nl

Source record: 45096

I'm reposting this, since I've had the grand total of ZERO response, so I'll try again :

I am having trouble with my SM124 monitor - it is less than 6 months old, but once it is switched on, the screen goes dead white, and then starts to flicker at an increasing rate, until the screen settles down to a `normal' picture, superimposed with white diagonal lines.

All I want to know is :

- What is wrong with my monitor?
- would someone with a basic knowledge of electronics (ie. me) be able to fix it?

I assume the monitor will still be under warranty, but I can't really afford to be without it for an appreciable length of time.

Any help would be *greatly* appreciated, email or otherwise.

Simon.

PS. Anyone got any recommendations for 100Mb hard drives?

I had a similar problem when I hit the dreaded folder limit in TOS 1.4. Although not as disastrous as with previous TOS's on my setup it cause some corruption somewhere. Over a period of weeks my AUTO programs started to refuse to load but could be started from the desktop (where you had the choice). Then I couldn't run them at all but other programs were OK. The it spread a bit further and I ended up backing the partition elsewhere, zeroing the partition and putting it all back. If it's a creeping problem then I'd zap the partition sooner rather than later.

Keith

1202. How do you set an ST204 to autoboot?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-22 04:48:47 UTC
From: bcc@Eyring.COM
Message-ID: <1992Mar22.044847.3422@Eyring.COM>
Source record: 45108

I just bought a used system from a friend. Among other things, it has an Atari ST204 20 Meg hard disk. He commented that he always had to boot from a floppy disk before he could access the hard disk. I thought that was strange, but he's right. With the limited tools I have, I cannot tell the hard disk that it's ok to boot directly. My question:

Is this an inherent limitation on the Atari Hard disk? I know that with Supra and ICD disks it is very common to have the system boot from the hard disk without a floppy in the drive. Is this because of something they did in Supra and ICD, or is it a limitation of the TOS version this machine has (1.0).

Please don't refer me to Genie or CIS, since I don't have access to those services. I do have e-mail and limited FTP access, but don't know where to look for this item. Can anyone suggest anything?

Thanks!

There is an info file on atari.archive called ibmdrive.lzh which may help you out. Also, TEAC drives are supposed to be free of the media change problem (which cannot be fixed with some drives without the addition of some logic or power, I cannot remember which).

In the mean time, there is a software utility called FMC (force media change) available from atari.archive that might help you out.

You should check out Desk Manager (available from atari.archive). It allows you to select which auto and acc's are loaded at bootup (but if you leave it alone, it will use the current configuration and will not slow things down at all). It also allows you to select configurations with hot keys at bootup (so if you want a "pure" bootup with no accs or weird TSR auto programs so you can test new software, or if you don't want to load GDOS every time, or whatever). It is very cool software, and does not get in the way unless you want to use it. Be sure to get PINHEAD as well, as it will increase the speed of your bootup manyfold.

Superboot is another one that does these things and more, and it too can be set up to not interfear with bootup unless you hot-key it (right before it runs). I cannot imagine using a hard disk on an ST without one of these types of programs, as so many combinations of acc's and auto folder programs do not work (as you have discovered). With them, you can easily experiment with the order of programs in the auto folder or which accs load, etc (and this experimentation is often needed to get things to work).

Superboot will also allow you to display a picture and play a sample on bootup, BTW. This can be really neat (I have a friend who displays a picture of a red dragon, and play a sample that says "My dear lady, we are ALL animals" in a somewhat daemonic voice; This sample is from a movie which I cannot remember right now), and can also be overridden with a keystroke if you are in a hurry.

Dave Small once said that the ST was approximately a 1 mip machine.

I need to find the files to modify an IBM mouse to work with my ol ST. Where would I find the files? Thanks...

(The old mouse was melted... sigh.)

X\section{Introduction}
XThis document is an attempt to specify the XBRA protocol for exception
Xvector chaining on the atariST series of computers. It is a response
Xto many requests I have received to document the protocol, and also an
Xencouragement for people grabbing exception vectors to use it. This protocol
Xwas not invented by me, nor is it perfect for every situation, but
Xstill is very useful because something is better than nothing. There
Xhave been other proposals, but IMHO this is the simplest and cleanest,
Xand does the job for which it was designed quite well. It has been
```

```
Xused quite widely, especially in Public Domain circles, and that is a
Xgood enough reason for me to follow it.
X
X\section{History}
XJust to set the record straight, and give credit where it is due, the
Xoriginal proposal for this protocol was made by Moshe Braner in an
XUsenet article sometime in 1988 (or was it 87, I do not remember). The
Xproposal was worked over by Julian Reschke in consultation with
XEdgar R\"oeder in Germany, where it ended up
Xin the present form. Julian Reschke has since been its chief spokesman, and
Xclearing house for registering unique XBRA identifiers. Atari Germany adopted
XXBRA as an ``official'' standard in 1989 but didn't do anything to push it.
XXBRA as I know it, came
Xback to me from Germany in the form of an include file for the Gnu C
Xlibrary, thanks to Edgar R\"oeder. In case you are wondering XBRA is an
Xabbreviation for e{\bf X}tended {\bf BRA}ner protocol.
X
X\section{Why XBRA}
XOn the 68K architecture, whenever an exception occurs, the current
Xprocessor state\footnote{What and how much of the processor state is
Xsaved varies with different models of the 68K family.}${}^,$\footnote{This
Xsaved information is known as an Exception Frame.} is saved on the
Xsupervisor stack (SSP), and then the processor effectively jumps
Xindirectly via a fixed location in memory to code that will handle
Xthat exception. This fixed location is known as the exception vector
Xfor that particular exception. Exception vectors are memory locations
Xfrom which the processor fetches the address of the code that will
Xhandle that exception when it occurs. Initially, all exception vectors
Xare initialized by TOS to point to handlers for the exceptions within
XTOS.
X
XNow suppose on an exception, your program needs to get control (say to
Xset a variable). A common practice is to ``hook your code into the
Xexception processing chain'', for the particular exception that your
Xprogram is interested in. What we mean by ``hooking your code in'' is
Xthat you make the exception vector point to your code, which in turns
Xpoints to wherever the original exception vector was pointing to. When the
Xexception occurs, your code is given control, and once it has done its
Xjob, control passes to other exception handlers in the chain. The last
Xhandler in this chain (usually the one installed there initially by
XTOS), finishes off the exception handling sequence by executing a RTE
Xinstruction, which restores the processor to the state in which it was before
Xthe exception occurred. Figure~\ref{fig:hooking} depicts what
Xhappens when you ``hook in your code''.
X
X\begin{figure}
X\begin{center}
X{\small%
X\input fig1.tex
X}
```

```
X\caption{Hooking into an Exception Vector}
X\label{fig:hooking}
X\end{center}
X\end{figure}
X
XIt is bad {\it karma} not to pass a control to the next exception
Xhandler in the chain. Even if your code can completely handle an
Xexception, it denies other handlers the opportunity to do what they
Xsupposed to do. Of course, there are situations where
Xpassing control to other handlers is not appropriate (for instance if
Xyou are intercepting a particular gemdos function
Xin order to replace it totally; in most other
Xcases you passing control on to the next handler is the thing to do).
X
XWhen you install a handler, by convention you install it at the head
Xof the exception chain. But you cannot assume that your handler will
Xalways remain there. Other processes can execute later and may insert
Xtheir own exception handlers. When it comes time to unhook
Xfirst you need to find yourself. This is where
XXBRA comes into its own. If the exception vector (the head of the
Xchain) does not point to your handler there is no way you can find it,
Xunless all handlers between the head and you follow a common
Xconventions to identify the handler and to find the pointer to
Xthe next element of this chain. The
XXBRA protocol specifies where to find, relative to the beginning of a handler,
Xthe next handler address. To avoid spurious identification
Xthe XBRA protocol further defines two magic numbers, again at fixed
Xoffsets relative to the handler. Now unchaining yourself becomes easy
Xand reliable. You either encountered yourself, or you continue
Xdown the chain by picking up the address of the next handler from a
Xfixed offset in the current handler. Once you have found yourself
Xyou check the two magic numbers, again at fixed offsets, to ensure
Xthat you actually hit an XBRA header rather than some random memory
Xlocation that just happens to have the value that you are looking
Xfor. If it all checks out, you can remove yourself reliably.
XFigure~\ref{fig:xbrachain} illustrates a typical XBRA exception chain.
X

X
X\section{The XBRA Protocol}
```

```
XA generic XBRA element looks like:
X{\small%
X\begin{center}
X{\tt%
X\begin{tabbing}
Xxxxx\=xxxxxxxxxxx\=xxxxxxxxxxxxxx\= \kill
Xstruct xbra \{ \\
X\> long \> xbra\_magic; \\
X\> long \> my\_magic; \\
X\> void \> (*next)(); \\
X\> $\langle$ exception code here $\rangle$ \\
X\};
X\end{tabbing}}
X\end{center}}
X
X{\tt xbra\_magic} is initialized to {\tt ``XBRA''} (0x58425241L hex).
X{\tt my\_magic} is a 32 bit value that you choose. In gcc compiled
Xapplications a default value is {\tt ``GNUC''} (0x474E5543L hex)
Xbut of course it may be changed. {\tt next} holds
Xthe address of the next exception handler in the chain. It is
Xinitialized when the handler is initially linked into the
Xchain, just past its head.
XThe code for your handler follows the {\tt next} field.
XYou will land at the address of the first word of this
Xcode when control is passed to this handler.
XUsually we do not put our handler right into the structure, but
Xinstead we put a jump instruction to our handler routine in the XBRA
Xstructure. This is a convenience for C programs and not a requirement of
Xthe XBRA protocol. In C there is no portable way to ensure that the code for
Xthe handler is contiguous to the XBRA header and in the same section (text or
Xdata section)
X Here is an example of how to install a handler into the
Xevent timer handoff vector (exception 0x100).
X{\small%
X\begin{verbatim}
Xvoid my_handler()
X{
X /* handler code */
X}
X
X#define _XBRA_MAGIC 0x58425241L /* "XBRA" */
X#define _GNUC_MAGIC 0x474E5543L /* "GNUC" */
X#define _JMP_OPCODE 0x4EF9
X#define _TIME_VEC 0x100
X
Xstruct __xbra {
X long xbra_magic;
X long gnu_magic;
X void (*next)();
X short jump;
```

```
X void (*handler_address)();
X} xbra = { _XBRA_MAGIC, /* XBRA magic */
X _GNUC_MAGIC, /* application magic */
X 0L, /* pointer to next handler */
X _JMP_OPCODE, /* jump instruction */
X my_handler /* address of our handler routine */
X };
X
Xvoid install_handler()
X{
X xbra.next = Setexc(_TIME_VEC, &xbra.jump);
X /*
X * Setexc returns the address of the old handler that we stash
X * away in xbra.next. In its place we put the address of the
X * jump instruction in the XBRA structure. When the processor
X * picks up this address, it executes the jump instruction to
X * the entry point of our handler function.
X */
X}
X\end{verbatim}}
X
XAfter our handler is installed, when the exception occurs it finally
Xgets control. It must do what it needs to, then branch to the next
Xexception handler in the chain (after it has cleaned up anything it
Xput on the stack)\footnote{GNUC users will have to be careful if using the
X\mbox{-fomit-frame-pointer} option.}. Please note that a piece
Xof an assembler code in the example below is using gcc syntax.
XA keyword {\tt volatile} is needed as a guard against an overzealous
Xoptimizer.
X
X{\small%
X\begin{verbatim}
Xvoid my_handler()
X{
X /* my handler code goes here */
X __asm__ volatile("unlk a6 /* clean up stack */
X movl _xbra+8, a0 /* address of next handler in A0 */
X} jmp a0@"); /* jump to it */
X\end{verbatim}}
X
XTo unlink our handler from the exception chain we first need to
Xlocate it in memory, and then make its predecessor point to its
Xsuccessor. This is where the XBRA protocol really comes into its own.
XWe begin the search at the exception vector looking for our XBRA
Xelements address. If our address is found we authenticate it
Xby testing the two magic numbers. Otherwise
Xwe travel down the chain by following the XBRA elements
X{\tt next} pointer.
X
X
```

```
X{\small%
X\begin{verbatim}
X/*
X * unlink a handler in a xbra friendly manner from the exc chain
X */
Xstatic void unlink_handler(me, exc)
Xxbra_struct *me;
Xint exc;
X{
X xbra_struct *this, *prev;
X long save_ssp;
X
X this = (xbra_struct *) /* get head of chain */
X ((unsigned long)Setexc(exc, -1L) - offsetof(xbra_struct, jump));
X if(this == me)
X { /* at the head, just unlink */
X Setexc(exc, me->next);
X return;
X }
X /* otherwise find me in the chain and unlink */
X save_ssp = Super(0L);
X for(prev = this; this && (this != me); prev = this,
X this = (xbra_struct *)((this->next)
X ? (((char *)(this->next)) - offsetof(xbra_struct, jump)) : 0))
X {
X /* validate the xbra */
X if(this->xbra_magic != _XBRA_MAGIC)
X { /* a non XBRA handler in the chain -- shame on you */
X Super(save_ssp);
X Setexc(exc, me->next); /* nuke it, otherwise it may call ME */
X return; /* after I am deinstalled */
X }
X }
X
X if( (this == me) && (this->gnuc_magic == _GNUC_MAGIC) )
X { /* unlink me from middle of the chain */
X prev->next = this->next;
X Super(save_ssp);
X return;
X }
X /* we are screwed */
X Super(save_ssp);
X Cconws("\r\nHandler not found!\r\n\n");
X}
X
X/* this routine may be called as unlink_handler(&xbra, _TIME_VEC) */
X\end{verbatim}}
X
X\section{Registering your XBRA}
XTo be fully XBRA compatible, your unique XBRA id must meet the following
```

```
Xcriteria:
X\begin{itemize}
X \item The id should contain only printable ASCII characters (32..126).
X \item The id has to be registered with Julian Reschke to ensure that
X it is unique. To do this you need to send mail to
X \mbox{julian@math.uni-muenster.de} or \mbox{jr@ms.maus.de} containing
X the following information:
X \begin{itemize}
X \item The full program name.
X \item Name of the author.
X \item XBRA id.
X \item Program status (PD, shareware, commercially and available
X from...).
X \item A list of used vectors.
X \end{itemize}
X\end{itemize}
XIf you are unable to send internet mail, i'll be glad to pass on your
Xrequest to Julian. I may be contacted on GEnie as \mbox{J.Bammi}
Xor on CompuServe as \mbox{71515,155}.
X
X\section{Risks}
XThere are two major risks in using the XBRA protocol as described above:
X\begin{itemize}
X \item Putting code in the data section.
X \item Overzealous use of vector grabbing.
X\end{itemize}
XAs described above we put a jump instruction in the XBRA structure that points
Xto our exception handler. Normally, C compilers will allocate this structure
Xin the data section, so when control is passed to our handler, an instruction
Xwill be fetched from the data section. Normally, this does not cause problems
Xon the atariST/TT architectures beacuse there is no protection.
XBut, if protection was ever enforced by TOS
Xwe would be in trouble, and we would end up with a segmentation violation as
Xcode would be fetched from a a non-text section. Putting the XBRA structure
Xin the text section is worse. Since we patch in the next address, it would
Xbe akin to self modifying code. On the 68030/40 machines this will not work
Xif the instruction cache is read-only. For now, putting the header in the data
Xsection seems to be the most reasonable and portable solution. But be aware
Xthat on the 030/040 you may have to force a cache flush after changing contents
Xto patch the next address, otherwise the system will crash.
X
XOn the subject of overzealous useage of XBRA Allan Pratt had the following
Xwords of advise:\\
X``It's just that I would have big banners all over it saying that
Xvector stealing is a bad idea in the first place. There are
Xjust a few vectors that you can legally steal, and a few more that
Xyou can reasonably steal. I would use only legal vectors
Xand legal uses in the examples. One kind of legal use for
Xa legal vector is a RAMdisk using hdv\_rw (and \_bpb and \_mediach).
XAlso, talk about unhooking vectors needs a whole raft of warnings
```

```
Xabout what a bad idea this is.
X
XThe right way to do almost anything that involves vector stealing is to
Xuse a TSR in the AUTO folder as a driver, and have a foreground
Xprogram communicate with that driver, usually through a trap it's
Xstealing or through the cookie the driver left in the cookie jar.
XThen there's never a question of unhooking. The driver is generally
Xsmall enough that you don't mind having it around even when you're
Xnot using the program in question.
X
XI guess I would just like to see more in the way of caveats, so people
Xwon't read this document and think that vector stealing is the best way
Xto do something. It often isn't. But that's all gravy on top of the
Xactual stated goal of the document, which is to describe XBRA itself.''
X
X\section{Conclusion}
XWe have tried to document the XBRA protocol, and to illustrate its usage
Xwith some typical code segments. Of course, your application may vary
Xin many details. The XBRA protocol does a good job of
Xreliably locating handlers in an exception chain and properly
Xinstalling and removing them from the chain. A complete example is
Xpresented in Appendix A. The {\tt xbra.h} include file from the GNUC
Xlibrary is presented in Appendix B.
X\clearpage

X Redaktion ST-Magazin
X Julian Reschke, Expertenforum
X Hans-Pinsel-Str. 2
X D-W8013 Haar bei Mnchen
X
X/* Weitergabe */
X
X...ist hochgradig erwnscht. Aber bitte *immer* nur in
Xunvernderter Form. Niemandem ist damit gedient, wenn es
Xverschiedene 'Fassungen' dieser Liste gibt.
```

```
X
X/* Neue Eintragungen */
X
XBitte IMMER verbogene Vektoren und Bezugsquelle nennen.
X`Reservierungen' werden nicht vorgenommen. Eine Rckmeldung
Xerfolgt nur dann, wenn eine Kennung nicht eingetragen werden
Xkonnte.
X
X/* Schreibweisen */
X
XMit 'C' gekennzeichnete Programme machen einen Eintrag in den
XCookie Jar, 'X' steht fr XBRA-Kennungen.
X
XMit '_' beginnende Cookie-Jar-Kennungen sind fr Atari
Xreserviert!
X
X'Offene' Cookies -- also solche, die von mehreren verschiedenen
XProgrammen gesetzt werden knnen -- sind mit '(Standardcookie)'
Xgekennzeichnet.
X
X/* Die Liste */
X
XC _CPU Atari Corporation
XCPU-Typ
X
XC _FDC Atari Corporation (Standardcookie)
XBeschreibt den Typ des vorhandenen Floppy-Controllers.
X
XC _FLK Atari Corporation (Standardcookie)
XGesetzt: File-Locking verfgbar (wird z. B. von 'MiNT 0.9'
Xbenutzt).
X
XC _FPU Atari Corporation
XInformationen ber die angeschlossene FPU
X
XC _FRB Atari Corporation
XZeiger auf DMA-Buffer im Fast-RAM
X
XC _INF Atari Corporation
XFix fr den Desktop.Inf-Bug im Desktop im TOS 1.06 des STE. In
Xder von K. Isakovic modifizierten Version MIT XBRA. Hngt sich
Xin den GEMDOS-Trap.
X
XC _MCH Atari Corporation
XTyp der verwendeten Hardware
X
XC _NET Atari Corporation (Standardcookie)
XTyp des verwendeten Netzwerks
X
XCX _OOL Allan Pratt, Atari Corporation
```

```
XPOOLFIX3, beseitigt ein Problem in der Speicherverwaltung von
XTOS 1.04 und TOS 1.06
X
XC _SLM Atari Corporation
XWird vom Diablo-Treiber (ab Version 1.4) gesetzt.
X
XC _SND Atari Corporation
XTyp der verwendeten Sound-Hardware
X
XC _SWI Atari Corporation
XZustand der 'configuration switches'
X
XC _VDO Atari Corporation
XTyp der verwendeten Video-Hardware
X
XX 8*8 Rainer Seitel
XSchriftumschaltung fr GEM-Programme
X
XX AgK0 Marcel Waldvogel
XAusGUCK-"RAM"-Disk
X
XX AHVR Alexander Herzlinger, OverScan GbR
XVRAM (virtuelle Speicherverwaltung fr den TT). Verbiegt hdv_rw,
Xhdv_bpb, buserror, ikbdsys...
X
XX AMC1 Arnd Beiner
XSoftware zur Monitor-Switchbox von Hard&Soft
X
XX AMC2 Arnd Beiner
XTreibersoftware zum PC-Tastaturinterface von Hard&Soft
X
XX AVOJ Oliver Joppich
XAnti-Virus-Programm
X
XX BASH Edgar Rder
XBourne-Again-Shell der FSF. Umgebogen: shell_p
X
XCX BIGS Julian Reschke, SciLab GmbH
XBigScreen 2, das neue BigScreen fr ST, STe und TT (verbiegt
XTrap 2, XBIOS und VBlank).
X
XX BIOC Tiemann Bjrn
XPirosca, Residenter Druckerspooler mit Hardcopy-Utility
X
XX BSIM Marcel Waldvogel
XBLiTSIM, ein "BLiTTER-Simulator" (hngt sich im TRAP #14 ein).
XEr meldet auf eine Blitmode()-Anfrage blo zurck, da ein
XBlitter installiert und aktiv sei.
X
XX BUG1 Markus Fritze
```

```
XBugaboo (Debugger)
X
XX CB2K Claus Brod
XPatch zur Behebung des "2KB-Gemdos-Bugs"
X
XX CBCE Claus Brod
Xmodifizierter Critical-Error-Handler
X
XX CBDF Claus Brod
X`DabbelFeature' (Umlenkung von Laufwerkszugriffen)
X
XX CBHD Claus Brod
XHarddisktreiber
X
XX CBHY Claus Brod
XTastaturtreiber in 'Hyperformat'
X
XX CBIT Guido Sawade
Xc't Bus-Interface-Treiber
X
XCX CHAM Karsten Isakovic
XAccessory zum Nachladen/Entfernen von Accessories.
X
XX CISY Ingo Ciechowski
XCISYSTEM (Ciechowsky Computer Innovations)
X
XX CKJR Julian Reschke
XInstalliert einen leeren Cookie Jar (ST-Magazin 3/1990).
XVerbiegt den Reset-Vektor.
X
XX CLK1 Dieter Jankowski
XUtility fr MEGA-ST Hardwareuhr
X
XX COLO Meinolf Schneider
X'Colos' (Mono->Color-Converter; Vertrieb ASH)
X
XX CRAC Protar
XProtar-Festplattentreiber
X
XCX CRIT Thomas Schrter, Fast Electronic GmbH
X'CRYPT-IT Personal Data Protection fr Atari ST/TT', verbiegt
Xdie drei hdv_-Vektoren.
X
XC CTCH Edgar Rder
XMaster-Modul catch.mmx (Abfangen von ^C, ^\ und ^Z, Timeouts fr
XProgramme)
X
XX CtCp Rasquin Jean-Pierre
X'CtCaps', CapsLock-Anzeige
X
```

```
XX CTSF Lars Erik Osterud
XCTSFIX.PRG -- 'CTS-bug fix'
X
XX DPRS Wilfried Cordes
XDruckerbuffer (PD)
X
XX DRIV Stefan Hintz
XDrive-Edit (verbiegt die drei Harddisk-Vektoren)
X
XX DRRH Dietmar Rabich
XWodan (Accessory zur Tastaturbelegung)
X
XX DSSO David von Stetten
XSOKRATES (Tastaturtreiber, verbiegt den IKBD-Vektor).
X
XC SYNL Robert Federle
X'Dynamic Link Library Driver V 1.10' -- ermglicht das Prinzip
Xdes dynamischen Linkens von Programmen, in dem die komplette
X'Purce C'-Bibliotheken im Speicher nur einmal vorhanden sind.
XFertige Programme erhalten nur eine Aufruf-Bibliothek, die pro
XFunktion nur 16 Bytes bentigt.
X
XC ENVR Pascal Fellerich
XProgramm zum Setzen des Desktop-Environments.
X
XX ETM M. Nick
XEntmauser
X
XX EXRA Marcel Waldvogel
XExtraRAM-Verwaltung fuer die FAFST-Beschleunigerkarte.
XHerstellung und Vertrieb: F. Aschwanden. Vektoren: GEMDOS, BIOS,
XXBIOS.
X
XX EXTD Robert Federle
X'TOS-Filename-Extender V1.04' -- mit diesem Accessory knnen
XPfadnamen verwendet werden, die eigentlich verboten sind (z. B.
X"EDITOR:EDITOR.PRG"), da smtliche GEMDOS- und AES-Funktionen,
Xdie Pfade bentigen, mit den "bersetzten" Pfaden aufgerufen
Xwerden. Verbogen: Trap #1, #2.
X
XX FALT Richard Kurz
XFALTOFF (Fixprogramm fr ein Problem bei Setscreen() auf
XMegaSTE's, PD).
X
XC FIX2 Uwe Seimet
XFIX24 (beschrnkt 68030-Adressierung auf 24 Bit, verffentlicht
Xin ST-Computer)
X
XX FLXD Alex Esser
XFlexdisk (Version 1.4)
```

```
X
XCX FLTP Patrick Dubbrow
XFlyTop, erlaubt Bestimmung der Position, an der fliegende
XDialogboxen erscheinen (verbiegt Trap 2 und -- bei
XNeuinstallierung des Cookie Jars -- resvector). Legt VSCR-Cookie
Xan. ST-Magazin 1/92.
X
XCF FOse Hayo Schmidt
XFontselector (ACC oder PRG) mit Zusatzprogramm FOSEINST.PRG
X(ST-Computer PD 430, PD-Pool 2239).
X
XX FSmp Martin Patzel
XFileselector (PD)
X
XX GABI Michael Schwingen
XGabriele 9009 IFD1-Emulator - Treiber fuer Schreibmaschine an
Xder seriellen Schnittstelle (verbesserte Version, Original war
Xmal in ST-Computer). Belegt Trap #13 und MFP Int #12
X
XC GDEV Edgar Rder
XGNU-C Device-Driver
XDer Wert ist ein Zeiger auf eine verkettete Liste von
XDevice-Records (eine genauere Beschreibung gibt es auf Anfrage),
Xdie von Programmen beim Start in eine entsprechende interne
XListe eingehaengt werden. Gemeinsam realisieren sie dann eine
Xdem /dev-Directory von Unix entsprechende Sammlung von
XGeraetetreibern (im Moment verfuegbar: /dev/tty, /dev/tty1,
X/dev/mouse, /dev/null, /dev/lp, weitere Treiber sind geplant).
X
XX GEMB GE-Soft
XHarddisktreiber.
X
XX GENV Julian Reschke
XGEM-Environment-Setter (ST-Magazin 6/1990)
X
XX GIGA Roland Alder
XGIGA-BOX St Driver
X
XX gkCO Gerd Knops
XCalamus Oberflchenmodul ((gkCO): Mausknopfroutine (ber VDI:
Xvex_butv) Mausbewegung (ber VDI: vex_motv))
X
XX gk5" Gerd Knops
XTreibersoftware fr 5.25" HIGH-Density-Drittlaufwerk (hdv_rw,
Xhdv_bpb, hdv_mediach, etv_critic)
X
XCX GMNI Stefan Eissing & Gereon Steffens
XGEMINI, der Shareware-Desktop
X
XX GNUC Edgar Rder
```

```
XGNU-CC Libraries (verbogen: alle Traps von Buserror bis
XTracetrap, kbd_vecs->ikbdsys, VBL, etv_term, etv_timer,
Xresvector)
X
XX GOff Laurenz Prner
XGrow- und Shrinkboxen abschalten (Trap #2)
X
XX HABO Julian Reschke
XHaBoo 1.8, Harddiskcache (erstmals verffentlicht in ST-Magazin
X6/1988). Hinweis: wird *nicht* mehr untersttzt, Nachfrage
Xzwecklos. Stattdessen TOS 1.04 (oder neuer) mit CACHENNN.PRG o.
X. benutzen!
X
XX HAMM Ingomar Otter & Hybrid Arts
XSoftware zum 'Melody Maker', verbiegt verschiedene
XTimer-Vektoren.
X
XX HcP6 Michael Schwingen
XNec-P6-Hardcopy in zwei Groessen, laeuft mit Hyperscreen. Belegt
XHardcopy-Vektor ($502)
X
XX HDDR Uwe Seimet
XHDDRIVER.PRG (Diskus-Plattentreiber ab Version 2.1)
X
XX HDJR Dieter Jankowski, Julian Reschke, Hard&Soft
XHard & Soft Harddisk-Interface
X
XX HDPR Roland Scholz
XHDPROTEC (Schreib- & Leseschutzprogramm)
X
XX HDSW Oliver Scheel
XHDSWITCH.PRG - High Density Switcher (z.Zt. V1.1). Konfiguration
Xfr HIDS. Verbiegt scr_dump. ber [LSHIFT][ALT][HELP] wird der
XModus gewechselt (auto, forced HD, forced DD)
X
XCX HFIX Patrick Dubbrow
X
XX HIDS Oliver Scheel
XHIGHDENS.PRG - High Density Disk Driver (z.Zt. V2.0). Verbiegt
Xetv_critic, hdv_bpb, hdv_rw, XBIOS. Braucht 1xVBI. Durch
XSchaltungsnderung der MAXON-HD-Lsung ist mit diesem Driver ein
X(fast) nicht bemerkbares High-Density Handling mglich,
Xinsbesondere bei 5 1/4"-Drives und/oder zwei Laufwerken.
X
XX HMDU Thomas Uhl
XSpeicherdump fr PMD des HM2-Systems, Exception 2-8
X
XX HMOC Andreas Alich
XObject-Cache fr Hnisch-Modula
X
```

```
XX HMRD Thomas Uhl
XRuntime-Debugger des Hnisch-Modula. Folgende Vektoren werden
Xverbogen: TRAP 0, 3-12, 15; Exceptionvektor 2-8, VBL-Interrupt
X
XX HMRS Thomas Uhl
XRuntime-System des HM2-Systems, Exception 2-8
X
XX HPHC Martin Wunderli
XHardcopy fr HP Deskjet; verbiegt Hardcopy-Vektor.
X
XX HPLJ Robert Federle
X"HP-Laserjet-Emulator V1.04" -- dieses Accessory wandelt die
XDrucker-Steuercodes eines HP-Laserjet-Druckers, die ber eine
XGEMDOS- oder BIOS-Funktion ausgegeben werden, in eine
XRaster-Grafik um. Benutzte Vektoren: Trap #1, Trap #13.
X
XX IBMP Lars Erik Osterud
XIBMPRINT.PRG -- 'Converts norwegian characters to IBM standard
Xprinter'
X
XX IDSK Stefan Becker
XICON-Desk (aus ST-Digital)
X
XX IMAC Wilfried Cordes
XBootsektor-Wchter (PD)
X
XC INSJ Oliver Groeger
XInsjar installiert einen Cookie-Jar oder erweitert einen bereits
Xbestehenden. Die fnf Standard-Cookies werden eingetragen. _CPU
Xund _FPU werden mit den Werten entsprechend der installierten
XHardware versorgt. Falls ein 68030 Board vorhanden ist, wird
X_longframe entsprechend gesetzt.
X
XC INXR Dietmar Pttmann/Dietmar Rabich
XIndexgenerator.
X
XX JAM1 Pascal Fellerich
X'Butler James'. Verbogene Vektoren sind hdv_rw, hdv_bpb, Trap
X#1, Trap #14, scrdump, MouseVec, IKBDsys. Auerdem wird ein
XVBL-Slot belegt. Bezugsquelle: div. Mailboxen, oder direkt beim
XAutor (-> siehe ST-Magazin 2/90)
X
XX JCNB Jens C. Neffe
XJCNBOOT (mausbedienbarer Bootselektor (Auto, Acc, Setups)).
XEventuell Verbogen: mousevec, etv_term, exec_os, resvector.
X
XX JCNC Jens C. Neffe
XKontrollfeld (little multi ACC). Verbogen etv_term, $114,
Xmousevec, kbdsys und vielleicht in Zukunft clockvec.
X
```

```
XX JCNH Jens C. Neffe
XHardcopyprogramm. Verbogen $100.
X
XX JCNT Jens C. Neffe
XTextverarbeitungsprogramm von Jens C. Neffe, Name COCTEAU (kann
Xsich noch ndern). Verbogen etv_term.
X
XX JSHD Jrgen Stessun
XHyper-Density Kontrollprogramm (ST-Computer 7 & 1989)
X
XX JUST Robert Irrgang, Trillian Computer AG
X'Justify'. Registriert alle Programm- und deren Datei-Aufrufe
Xund sichert diese. Diese Informationen knnen dann ausgewertet
Xwerden. Verbogen: GEMDOS-Trap.
X
XX KbEv Michael Seyfried
XKeyboard-Handling-Modul fr MM2
X
XX KIDI Robert Irrgang
XRamdisk.
X
XX LALA Laurenz Prner
XALBOLALA! Modul zum Abspielen von Samples via bell_hook
X(ST-Magazin 1/92).
X
XCX LAWC Robert Federle
X'Look-Ahead-Write-Cache V1.10' -- dieses Cache-Utility setzt zum
XLesen von Sektoren das Look-Ahead-Verfahren und zum Schreiben
Xeinen Write-Cache ein. Benutzte Vektoren: hdv_rw.
X
XX LLCR Logilex
X1st_lock (hdv-Vektoren).
X
XCX LTMF Oliver Scheel
XLETEMFLY.PRG bzw. LET_LGHT.PRG - Let 'em Fly! Verbiegt: TRAP #2
X(AES/VDI), TRAP #13 (BIOS). Ersetzt/erweitert fast alle
Xform_xxxx Routinen des AES. Dadurch sind jetzt viele Dialoge a)
Xflugfhig, b) ber die Tastatur zu bedienen und c) bei
XEdit-Feldern mit zustzlichen Funktionen ausgestattet. Weiterhin
Xwird ber den Cookie-Jar eine Flugroutine fr non-form_do()
XDialoge bereitgestellt. Status: Freeware.
X
XX LPCD Laurenz Prner
XCarrier-Detector
X
XX LPJM Laurenz Prner
XJoy-Mouse (ST-Magazin 7 & 89)
X
XX LP/2 Laurenz Prner
XMalloc/2, Gemdos-Vektor, vorgestellt im ST-Magazin 3/91.
```

```
X
XCX macc Ken Badertscher, Atari Corporation
XMACCEL 3.3 (verbiegt MFP rec. buffer full, mousevec, ikbdsys).
XDer Cookie hat einen anderen (nicht druckbaren) Wert.
X
XC MADD Uwe Seimet
XADDMEM (Nutzung des TT-RAM trotz 24-Bit-Adressierung,
Xverffentlicht in ST-Computer)
X
XX MAST Naumann&Rder
XMaster (verbogen: Buserror, Trap #1, Trap #13, etv_critic,
Xetv_term, _shell_p, resvector (old_resvalid steht direct vor dem
X'XBRA'))
X
XCX MFNT Hayo Schmidt
XFontloader-Accessory oder Programm mit Zusatzprogramm
XMFNTINST.PRG (PD-Pool 2240).
X
XCX MGEM Pascal Merle
XMulti-GEM (Maxon GmbH).
X
XX MID3 Lars Erik Osterud
XMIDINET3.PRG -- 'Resident MidiNet terminal (for use with MiniBBS)'
X
XX MIMA Oliver Scheel
XMIDIMAN.PRG/ACC - MIDI-Manager (z.Zt V1.0) (verbiegt: midisys,
Xklinkt aus: midivec, braucht: 1xVBI). Ein MIDI-Utility welches
Xes erlaubt SysEx-Daten auszutauschen, einen MIDI-Monitor, ein
XMIDI-Keyboard, einen MIDI-Filter und latrlich MIDI-Thru
Xenthlt.
X
XCX MiNT Eric Smith
XMiNT (MiNT is Not TOS) -- Multitasking-Erweiterung fr GEMDOS.
X
XX MJAF Martin Jahr
XAUTOFONT
X
XX MKHC Marcus Kraft
XHardcopy-Fix (ST-Computer 12 & 1989)
X
XC MkJr Thomas Schallar
XDerCookie identifiziert mein MakeCookieJar Auto-Ordner-Programm,
Xdass auf allen Nicht-STEs bzw. Nicht-TTs einen Cookie Jar
Xeinrichtet. Die vier Systemcookies werden angelegt, wobei _CPU
Xdie Prozessortypen 68000, 68010, 68020 und 68030 (sauber)
Xunterscheidet, die anderen Cookies jedoch fixe Werte zugewiesen
Xbekommen (entsprechend einem [Mega] ST[F[M]]).
X
XX MM_2 Markus Fritze
XMidimaze 2 (Shareware).
```

```
X
XX MMUT Oliver Scheel
XMM2_UTIL.PRG - Midi-Maze ][ Utility. Verbiegt: midivec. Mit
X_THE_ Midi-Maze ][ Utility wird der Ringtest etwas komfortabler
Xgestaltet. Weiterhin ist durch ein MIDI Thru eine verlassen von
XMidi-Maze mglich, ohne da der Ring zusammenbricht. Status:
XFreeware.
X
XX MRAM Rainer Seitel
XMehr RAM (vergrert den freien Speicher)
X
XX MSPD Lars Erik Osterud
XMSPEED.PRG -- 'Very small and simple mouse speeder'
X
XCX MUPF Gereon Steffens
X'Mupfel' (Unix-Shell)
X
XX NERV Laurenz Prner/ST-Magazin
XUnterbindet die etv-critic-Alertbox auf den Laufwerken A: und
XB: nach mehrmaligem Versuch.
X
XX NETS PAM's Software
XTreibersoftware zur Novell-Netware
X
XX NOR5 Lars Erik Osterud
XNORKEY5.PRG -- 'Norwegian keyboard-driver with lots of extra
Xstuff'
X
XX NO7P Lars Erik Osterud
XNO7PRINT.PRG -- 'Converts norwegian characters to 7-bits
Xprinters'
X
XX NSC1 Noud v. Kruysbergen
XN_SYSCOM 1.1 -- ein Accessory, das alle GEMDOS-, XBIOS-, BIOS-
Xund GEM- Aufrufe auf dem Bildschirm anzeigt.
X
XCX NVDI Sven&Wilfried Behne, BELA
XBildschirmbeschleuniger mit integriertem GDOS, der das ATARI VDI
Xkomplett ersetzt. Verndert LINEA, GEM, GEMDOS, BIOS, XBIOS und
Xden LINE-A Vektor.
X
XX N203 Noud v. Kruysbergen
XMultipurpose accessory (vernderte Vektoren: Timer C, GEMDOS,
XBIOS, XBIOS, Hardcopy, hdv_rw, hdv_bpb, hdv_mediach, Tastatur,
XMaus, Vblank)
X
XCX OFLS Hans-Jrgen Richstein (Standardcookie)
X...zur Protokollierung, wieviele Dateien noch auf welchem
XLaufwerk geffnet sind. Wird von dem PD-Programm 'CHECK_OFLS'
Ximplementiert. Dokumentation siehe Manual und ST-Magazin
```

X11/1991.
X
XCX OVER Karsten Isakovic, OverScan GbR
XTreiber zur AutoSwitch-OverScan Hardware. Verndert GEM, GEMDOS,
XBIOS, XBIOS, LINEA, IKBDSYS, IPL_4, VBL und RESET Vektoren.
XDazugehrige Tools:
X
XX OVUT OVERUTIL Bildschirmschoner, Desktopuhr (Mousespeeder iV)
XX OVIM OVER_IMG Hardcopytreiber fr IMG-Files
XX OV24 OVER_24N Hardcopytreiber fr 24 Nadel-Drucker
XX OVEP OVER_EPS Hardcopytreiber fr 9 Nadel-Drucker?
XX OVDJ OVER_DJT Hardcopytreiber fr HP-DeskJet
XX OVLS OVER_LSB Patch fr DMC-Laserbrain
XX OVFS OVER_FSB OverScan Fileselector Patch
XX OVWI OVER_WIN OverScan Window-Size Patch
XX OVEX OVER_EXC OverScan Exception Patch
XX OVRD OVER_RAM OverScan RamDisk (iV)
X
XX PAMN PAM's Software
XTreibersoftware zum PAM's-Net
X
XX PFIX Julian Reschke, SciLab GmbH
XPTSINFIX (behebt einen Fehler im VDI des TOS 3.01)
X
XX Pinp Jens Schmidt
XTreiber fr die Eingabe vom parallelen Port. Verbogene Vektoren
Xsind $100, $51E, $53E, $55E und $57E. Dieser Treiber lt den
XPort fr einen anderen Rechner wie einen Drucker aussehen (mit
Xeinem Kabel, bei dem Strobe und Busy gekreuzt sind) und
Xermglicht das Lesen von diesem Port mit den BIOS-Routinen.
X
XX PKSH Pahlen & Krau Software
XPKS-Shell (verbiegt _shell_p)
X
XC PMMU Alexander Herzlinger (Standardcookie)
X...zur Programmierung der PMMU, vorgeschlagen von Alexander
XHerzlinger. Dokumentation siehe u. a. im Handbuch zu 'VRAM'
X(OverScan GbR).
X
XX PRCS Peter Rohde
X"copySTar v4.0", Kopierprogramm (ab Version 4.0)
X
XX PRDS Peter Rohde
X"PR's Disk-Speeder v1.1", Harddiskcache
X
XX PRN Michal Bernards/ST-Magazin
XWandelSZ - hngt im BIOS und wandelt das des ST in ein
XMS-DOS- um.
X
XX PRO5 Lars Erik Osterud

```
XPROTECT5.PRG -- 'Resident virus check/kill/prtotect program'
X
XX PROT Meinolf Schneider
X'Protos' (Screen-Utility; Vertrieb Application Systems
XHeidelberg)
X
XX PRTD Robert Federle
X'Print To Disk V1.10' -- leitet die GEMDOS- und BIOS-Ausgaben
Xfr den Drucker in eine Datei um. Benutzte Vektoren: Trap #1,
XTrap #13.
X
XX PRTO Peter Rohde
X"ST-Tools v1.0"
X
XX PRTR Protar
XProtar-Wechselplattentreiber
X
XX prtr Konrad Hinsen

1209. TT and spectre....

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-23 08:22:49 UTC
From: charles@aurora.unice.fr
Message-ID: <1992Mar23.082249.7125@taloa.unice.fr>
Source record: 45114

Hi atari user

I look for spectre user on TT/STE in order to exchange experiences. For the moment I have big problems to avoid spectre not to crash on my TT !!!!

I think it could be nice to start checking all software that make spectre crashes (and minor problems.....) on ST/STE and..TT. In my opinion it could be useful to get a such list in order to facilitate the hard life of spectre user (I personnaly check spectre with more than 200 software on STE/TT).

Don't hesitate to mail me

charles@aurora.unice.fr

Tony.

1210. Re: comp.sys.atari.st.tech

In article <1992Mar23.151138.2369@otago.ac.nz> cosc226@otago.ac.nz writes:
This is my first attempt at a post so please forgive any muck ups...

Here's the question - I recently read about a hack purporting to give
'32k colours' on the screen. I have also acquired the file with the docs
for this. I am however having difficulty in finding the ZOO program I
need to dearchive it. Would someone be able to post me the ZOO bin. for the
ST...

Secondly a bit of background please. How much expertise does the install-
ation of the 32k colours hack involve. I put in overscan ok... And what
does it require in the way of software - (I'm sure that COLOR 23452 won't
work all that well :-)

Please Post responses to the 32K question, and if you can't send me a ZOO
exec. then could someone tell me where (and how!) I can get hold of it.

TNX in advance, Gneil

You'll find the ZOO program in the archivers-directory at
atari.archive.umich.edu.
I was thinking about installing the 32K color-hack myself a couple of
months back, but I didn't succeed in finding exact doc's on how to do
this. The doc's at a.a doesn't include a circuit-diagram, which is
what I need.
The hack involves installing a second shifter-chip, and looks fairly
simple. I still want a circuit-diagram before I start ripping my ST
apart though :-)

Your ST will still be compatible with all existing software, and the
new colors can be accessed in exactly the same way as on an STE. The
hack just uses more bits from the palette-registers.

If you have the cicuit-diagram, can you please mail it to me?

1211. Mega needs two boots

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-23 17:04:43 UTC
From: erik@microware.com
Message-ID: <12406@mcrware.UUCP>
Source record: 45116

Hello,

My Mega 4 just took a turn for worse and now powers up to a black screen when it is cold. But, if I then reboot it is fine.

Could this be a power supply problem? (1st boot just primes it?)

How much trouble is it to put a GOOD power supply in an Atari?

Any help is appreciated,

Erik Johnson erik@microware.com

1212. Optical disk-drives and the ST....

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-23 23:44:59 UTC
From: ssw9@aber.ac.uk
Message-ID: <1992Mar23.234459.3666@aber.ac.uk>
Source record: 45117

Another question....

Is it possible, or has anyone actually managed, to connect an IBM
optical diskdrive to either an ST or a TT? Does anyone know if it is actually
possible? According to an acquaintance of mine, it should be possible to
hook up an IBM optical drive to the ST's hard-drive port, and somehow convice
the ST that the opti-drive is a hard disk?

Has anyone managed this?
Are optical drives actually available for the ST? If so, how much do they cost?
Can an IBM opti-drive be connected to the ST? (I am able to get a 200Mb optical
drive for less than the price of a 100Mb hard-disk!)

Any feedback, email or otherwise, would be greatly appreciated. I will summarise
if I recieve enough feedback.

Thankx in advance.

Simon.

1213. Getting longer filenames out of GEMDOS

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-24 00:25:49 UTC
From: wallmann@backus.pu.informatik.th-darmstadt.de
Message-ID: <1992Mar24.002549.31258@infoserver.th-darmstadt.de>
Source record: 45118

```
It appears to me that even with the coming of MTOS we will still
be stuck with FILENAME.EXT for the future. This isn't
all that desirable for some folks (like myself). I will put out a few
ideas how to get longer filenames out of GEMDOS , and maybe you'd like
to comment on it. (Eventually we will force Atari & Microsoft to adapt
this standard (har har))

o The most obvious: kill GEMDOS beneath the system calls. This implies
a totally new disc structure (*slobber*)

o The most simple: add a translation table to the disk structure, that maps
long filenames to short filenames (uniquely of course, short filenames
should be then out of reach for regular GEMDOS accesss (like Fopen..).
This requires with HDs a lot of RAM for caching and slows down I/O a bit.

o The most kludgey: in an effort to remain MSDOS compatible, how about this:
Since a directory entry is somewhat like this (pseudo-C)

struct _foo
{
char filename[8],
ext[3],
filetype,
otherstuff[ 20];
}

one might consider allocating two successive entries in the directory
table. So that the full filename would be constructed from this

struct _baz
{
char filename[8],
ext[3],
filetype,
otherstuff[ 20];
unused = 0xE5;
longfilename[ 31];
}

union _bar
{
struct _foo;
struct _baz;
}

pseudo access code (just for illustration purposes):
/* ---------------------------------------------------------------- */
```

```
#define LONGFILENAME 0x80

extern char *filename;
_bar *p;

if( ! (p->_foo.filetype & LONGFILENAME))
{
memcpy( filename, p->_foo.filename, 11);
return;
}
memcpy( filename, p->_baz.filename, 8);
memcpy( filename, p->_baz.longfilename, 31);
memcpy( filename, p->_baz.ext, 3);
return;
/* ------------------------------------------------------------------- */

In order to hide the second entry from older TOS versions and MSDOS
one might set longfilename to $E5 per default, as to not have it
listed in the old-style DIR search. Maybe the filetype byte ought to
be left alone as well. All this oughta yield a max filesize of ca.
40 chars, which is a LOT better than 11.
To distinguish between oldstyle and newstyle filenames, one can use
a free filetype bit.

Conceivably 'kludgey' could even be done w/o the official sanctioning
of Atari.

Nat!

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,pa.forsale

An associate has a MEGA-4 he would like to sell.
Purchased new in 1990.
Tos 1.2 onboard.

He is asking $400.00 o.b.o

He also has a Supercharger PC Emulator
with 1-meg. $300.00 o.b.o.

Please contact me via the net or at home: (412)929-4023.
or him at : (412)832-9280.

I am in S.W. Pennsylvania about 30 mi. S. of Pittsburgh.
He could probably deliver it to you via UPS or (distance permitting) in person.

Please do not hesitate to call...
Thanx.

1215. Interrupting TOS

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-24 02:13:25 UTC
From: Arthur_Leung@mindlink.bc.ca
Message-ID: <10945@mindlink.bc.ca>
Source record: 45120

I am in the process of porting a program from PC to the Atari. The program involves some low level system programming, and there's where I need help. I have not done much low level programming on the ST, so here are a few questions:

1. According to the documentation that I have, BIOS will _changed_ the return address on the stack on return. What does this mean?

2. When I interrupt BIOS, is there anything else to save beside d0-d7/a0-a6?

3. What's the difference between the following:

```
jmp old_routine
```

and

```
move.l old_routine, -(a7)
rts
```

Thanks for any help!

Arthur

^^^^^^^

i, too, have problems when my system is "cold". by cold here i mean powered down for 1/2 hr or more. the room is about 75 F. i figure it might need chip reseating (?) or might have a weak solder connection (the added heat causes some board to warp acceptably). it could also be in my megafile 60, too. i dunno. wait 10-15 minutes, reboot, and all is well.

>Could this be a power supply problem? (1st boot just primes it?)

if you find out, please let me (and the rest of us) know.

> are being waylaid... Should I be using something other than:
> for (tc = 0; (c = fgetc(stdin) != EOF); tc++);
> to grab the incoming characters?
>

this is a common error: a degas file contains binary data,
which must be read in in binary mode. by default all buffered i/o is
done in text mode, and the standard streams (stdin/out/err) are set up
at startup in text mode. to switch an already open stream to a
different mode, you need to close it/freopen it using appropriate
modes (the mode arg contains an optional char 'b' or 't', for binary
and text modes respectively. not specifying 'b' is like specifying 't'
by default).
there is a convenince call binmode(1), which will implictly
open all further streams in binary mode. binmode(0) will reverse the
effect. remember that binmode(1) take effect for streams opened after
the call, and stdin/out/err are opened before your main() function is
invoked, so binmode() has no effect on them.
a short cut was to change the mode of an already open stream
is to or in the mode switch *before* the stream is ever used:
stdin->_flag |= _IOBIN; /* force switch to binary mode */
to undo this you could
fflush(stdin); stdin->_flag &= ~_IOBIN; /* force text mode */
(WARNING: potentially losing some buffered data).

also, when reading binary data the EOF test
(c = fgetc(fp)) == EOF
is not a reliable test. the preferred way to do this is
while(!feof(fp))
{
c = fgetc(fp);
.....
}

hope that helps,

Ok, I have an opportunity to do some programming, but here's the part that hurts: It's for a mac.. Guess what - I've got an ST and a PC...
So, my question is this: How good is Spectre GCR at emulating a Mac? Will it run _ALL_ software a normal mac will? Are there any 'gotcha's??
Does it just use my built-in memory, so that I would need to get more than my current 1 meg to do anything useful?
What's the general feeling of the Spectre community? Can GCR replace a MAC?
I would appreciate any and all e-mail or postings..
Thanks,

1219. ICD Host Adapter

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-24 06:11:17 UTC
From: ec333way@sail.uwaterloo.ca
Message-ID: <1992Mar24.061117.7944@watserv1.waterloo.edu>
Source record: 45124

Ok, I've got one of the nice and old ICD host adapters.. I think it's 1988 or 89 vintage.. I have an omti 8527 (the RLL) controller and a Tulin Tl240 RLL drive. My question is this: If I want to add more hard drive space to my ST, what are my options? Can I just buy an old MFM st-506 drive and plug it in as a second drive? Or do I need a second RLL drive?
If I was willing to trash my old drive altogether, would I be able to hook up a SCSI drive straight to the host adapter? Can the software (I have 4.8.x) handle these beasts?

1220. MiNT SIGTSTOP question

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-24 06:36:47 UTC
From: dstailey@gsfc.nasa.gov
Message-ID: <1992Mar24.063647.4914@nsisrv.gsfc.nasa.gov>
Source record: 45125
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'm trying to port ASH, the public domain Bourne shell clone, to the MiNT environment. Job control is supported, but none of the job control related builtins are giving any results. After activating the debugging routines for jobs.c, I got the following results when sending the pause-jove command to a MiNT port of JOVE. Since this is my port of JOVE, I know this does a SIGTSTOP.

```
JOVE (Text) Buffer: Main "[No file]" - (00:01)
wait returns 98, status=4641
Changin status of proc 98 from 0xffffffff to 0x1221
Job 1: changing state from 0 to 2
Signal 33
showjobs(1) called
dowait(0) called
wait returns 0, status=1212144
```

Note that the exit status returned from wait3() is 4641, indicating that JOVE was sent signal "33," which falls outside of the maximum count of signals in wait.h. However, in wait.h I do notice the line:

```
#define WSTOPPED 33 /* fake "signal" for stopped processes */
```

The code to ASH contains no explicit reference to WSTOPPED, but perhaps this is coded into wait3(). Should I add extra code to handle this exit status, or is there something I'm missing?

Thanks for any help.

Source record: 45126

Hello

A friend of mine has got a Brother CE-60 electronic typewriter and
he'd like to hook it onto his ST. Two years ago this model went out of
the market so it's a bit hard for him to find an interface for it.
Does anybody know this typewriter and/or has suggestions for an
interface? Thanx in advance,

Sander STOks
vince@pomeron.sci.kun.nl

1222. Tape Streamers

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-24 12:28:34 UTC
From: jas@dcs.warwick.ac.uk
Message-ID: <1992Mar24.122834.12650@dcs.warwick.ac.uk>
Source record: 45127

I know that you can connect a SCSI Hard Disk to the ST using a controller like ICD's, and that the driver software comes with the controller. I also want to put a SCSI tape streamer in the back of my ST, but I don't know what software I will need to drive it. What is out there for this? Does it come with the ICD (or other) controller? Is it commercial or PD?

Any help appreciated,

Jas.

3. What's the difference between the following:
jmp old_routine
and
move.l old_routine, -(a7)
rts

Am I right when I assume that you have stolen a system vector and
placed the old adress in the address at old_routine?

Steal vector : move.l $70,old_routine
move.l #my_routine,$70
---
my_routine: <do somethin>
move.l old_routine,-(a7)
rts

old_routine: ds.l 1

If that's the way you have done it only the second one wll work. The
jmp old_routine instruction will probably cause a crash.

If old_routine is a program label only the first one will work.

Source record: 45129

I have two other alternatives:

- On a directory table there is 10 bytes unused per file. This can be
used to extend the filename to 18 characters.

- On IBM world there is a program called 4DOS that creates a file
called DESCRIPT.ION that is hidden and that contains descriptions
of the files on that directory. A program would have to be written
to update the descriptions when files are erased, copied or moved.
Another program would read the descriptions and update the directory
window. I wouldn't mind sacrificing the date and time to have more space.

I think that's still an unanswered question. If MultiTOS is truly based
on MiNT, it may be possible to use MiNT's installable file systems.
The real bottleneck is that the AES and application software assume
the 8+3 filename format and the backslash path delimiter.

>HELP!!!
>I would like to know how ATARI is seen world wide to know if it has a
>FUTURE!

Over here in Germany, Atari definitely has a future. Some Universities and
other academic institutes have Atari STs running in networks together with
IBM-clones and/or mainframes like VAX under VMS or various UNIX systems.
I hope that we will have such a network here at our place soon.
Many people who have something to do with those networks appreciate the fact
that the STs do not cause all kinds of weird problems in the network because
of different BIOSes and the like. Also, there is no twisted 640K border ...
The major disadvantage of the STs is that there is a lack of "serious"
software. Of course, there are programs around for almost every purpose,
and many of them are low-cost and shareware, but large program packages
with lots of programs that cooperate and work reliably, and that are
supported by a competent group are rare in the ST scene. In our institute,
a lot of genetic research is done, and there is no genetic software package
for the ST known to me, whereas there are such packages for clones and for
macintoshs.
My idea is, that this situation was caused by the fact that the ST is easier
to program than the clones and the mac. Therefore, commercial developers
faced more concurrence by PD programs, and so they moved to other systems.
However, this development will not necessarily continue. As I see it,
MSDOS has reached its limit, and I expect it to disappear in the future
(and I really hope so), especially because all reasonable clones can run
UNIX these days. Atari, on the other hand, is about to release one of the
finest microcomputer operating systems, MultiTOS. I could well imagine
that Atari computers will partly take the place those stone-age-clones
hold today ...

From: cummins@a.cs.okstate.edu
Message-ID: <1992Mar24.183800.15069@a.cs.okstate.edu>
Source record: 45133

I have a question.
I'm at an American university with 100Mbit/second FDDI and
10Mbit/second ethernet and 16Mbit (I think) token ring available.
My ST is interfaced via rs232 persently at 9.6kbaud and I'm frustrated.
Just how do folks in Germany interface via token-ring or Ethernet?
I have a Mega2 if it makes any difference.

Thanks!
jc

For your sanity, i hope not. I have had a 3 1/2 year thread with all companies
that offer ethernet hardware and just recently finally gave up. Not that i
don't know how to network (all my other computers just run fine), but whenever
it comes to serious applications, atari companies usually screw up.

<stuff deleted...>
> The major disadvantage of the STs is that there is a lack of "serious"
>software.

as you name it...

<stuff deleted...>
>As I see it,
>MSDOS has reached its limit, and I expect it to disappear in the future
>(and I really hope so),

Good joke! Messy-dos shure is an ugly beast, but i take any bets that it
will live longer than any atari operating system (easy, 'cause it was
there earlier, so when they live infinitely, dos still will be older...)

<speculations about to-come stuff deleted>

now, malcolm: lack of support was there from the very beginning. Atari is
especially good at things like that. I would suspect if they do not manage
to cut prices dramatically within the next, say 1-3 years, they will for
shure get seriously into trouble. A Pee-Cee 5 times as fast as an St with
a reasonable HD & ram & 70Hz hires screen costs as much as an st over here,
with still steeper slopes on the pc-price curve. As Atari has f***ed up
on the notebook too, there is even bigger tendency to live with weird
applications. (last month i set up a 386 notebook with GEM & Wordplus for

one of my users, and he's just happy 8-}). In my opinion a TT with 200 meg drive & 19" screen must not cost more than, say 1500$. In our country the prices for low end unix boxes (20-100 times as fast as an st) range from 3500 - 5000$ for a very complete system including licences, so that sets the range. As atari always has screwed up on real high-tech i hope they will cut prices drastically on their existing stuff to survive, otherwise all we'll see from them in the future is pacman,lynx & co.

Message-ID: <1992Mar24.201814.25102@usenet.ins.cwru.edu>
Source record: 45136

In a previous article, wallmann@backus.pu.informatik.th-darmstadt.de (Natuerlich!) sagt:
+It appears to me that even with the coming of MTOS we will still
+be stuck with FILENAME.EXT for the future. This isn't
+all that desirable for some folks (like myself). I will put out a few
+ideas how to get longer filenames out of GEMDOS , and maybe you'd like
+to comment on it. (Eventually we will force Atari & Microsoft to adapt
+this standard (har har))

It might not be quite the same thing, but I rather fancy the idea of using the first few bytes of the file to contain its name, plus maybe an icon. This could be done within the MSDOS rules, although there would be problems about how the files could have individual names in the disk's directory. Maybe the first 11 characters of each extended filename would have to be unique..

There's probably some horribly obvious flaw in this method. (:

Message-ID: <1992Mar24.203543.25775@a.cs.okstate.edu>
Source record: 45137

For those considering building an SST, I ask:

What is the minimum memory speed to get maximum throughput from a 40Mhz
68030 (for instance in the Gadgets SST board)???

How about the same question, but a 50Mhz 68030 and crystal?

I need to budget for expansion, and I plan on going with MiNT, GNU, and
a lot more screen. Please post or e-mail responses! Short answers welcome!!!
(since a few short answers will contain the info I need!!!)

I'm almost certain this is wrong (I'm assuming memory access every clock
cycle...) but I want folks to know I need help here...

I figure 1/80ns = 12.5MHz (less than 50Mhz or 40Mhz for that matter...
Must be tooooo slow!)
So 1/50Mhz = 20ns (humm... don't thing 4MB simms are available that quick,
Maybe this is overkill? Sure hope so!!!)

Please reply!
jc cummins@a.cs.okstate.edu

Either option should be available to you if the OMTI, like the
adaptec, supports 2 logical units. Look for a second 20 pin connector
on the OMTI card. You also need to press a second connector in the middle
of the 37 pin cable.
SCSI drives may not work, unless you use older ones or get replacement
PALs from ICD. I replaced the pals on an original ICD card to hook up a
Syquest as a second drive, but when I tried adding a Quantum, the ICD card
wouldn't recognise it. I ended up buying a new ADscsi card.

Yes I do aggree with you.

I did noticed that a UK, magazine has now droped Atari from its pages.

Also the Miracle piano tutor thing, why no Atari version,
is the Atari not a midi machine that is sold in music shops, well not
here in NZ....

Or are we just being fed lyes or posible wish full thinging..

Yes I have bean told to get support here for Atari that we will have to
go to OZZ..???

I don't think that any one in his right mind will touch Atari now, the company
will never change and it has left to many bad tasts in people mouths..

My next machine will be a ACORN Archemides A5000 and these are far
cheaper here that any thing that Atari can offer me, it out performs
a TT and comes with a Muti-sync monitor for some $2300nz less than a TT..!!

At lest ACORN have a office here..!! Atari does not have any thing at all...

>or ec333way@sail.uwaterloo.ca

For programming, Think C V4.0. is fine. I made a few inits with it, did
some larger projects. It works very well.

The debugger, source debugger that is, has to be modified with RESEDIT
to map out some checks for a floating point unit, otherwise the source
debugger will dump the Spectre into oblivion.

I could post the resource fork modifications so it works 100%.

Comments about Pascal:

The only problem I have is with Think Pascal's editor...its buggier
than hell on a real Mac too.

Why? MultiTOS's is based on MiNT. Check the MiNT functions Dopendir(),
Dreaddir(), Dclosedir() and Fxattr() and the Minix filesystem driver
available for MiNT.

( ) English docs are promised.

... but unfortunately slow in coming. However, if you are willing to
put up with my English, and with mail reply delays, feel free to contact
me via email. BTW, the limitation to a two-stage login sequence is still
there, and hacking the uucico program will only partly solve the problem
because the programs that call uucico (notably uuwork) also have the
two-stage limit.

If you have a working version of a three-stage uucico, and only one site
to call, you might try the following:

a) rename your uucico to something different
b) write a uucico.par file for your version and store in it a safe place
c) write a little program called "uucico" that copies in your uucico.par
file (overwriting the one just created by uuwork) and calls the "hidden"
uucico.

This will make it impossible to get polled, but that problem is surmountable.
You could analyse the uucico.par file that is there and then decide what to
do.

( ) I have similar problems with it, but mine occur when I try to uuto a file to
( ) my ST. It gets here, but as a strange file name.
You must always let the filename start with ~/, or (at least) the first
letter will be munged. Better still, get HERMES (shareware, written by me)
from atari.archive.umich.edu. You still have than ~/ quirk, but HERMES has
never ever (to my knowledge) munged a directory structure.

( ) Are the sources available anywhere? I would be glad to fix up that portion.
Yes, I have them (not only the HERMES sources, but also the Mercury ones).
But the UUCICO program is compiled BASIC!

Can some one help me with PCspeed..

A friend brought a Mega 1 with PCspeed included, but alas no manual
and the shop no longer sells Atari..

So how does one get this to work with his Mega file 44, he does have
all the software and a copy of MSDOS 3.3, so were do we go from here...

Thanks..

Source record: 44949

Well, I've just splashed out on upgrading my internal drive to
a 1 meg beast. However, I understand that I'll need to make some
case modifications. What does this intail?
I presume that the new drive face is a different shape and so I'll need
to alter the right-hand side bit (where the old drive face is flush
with the case).
Is this right? Any tips on how to go about it? I had thought of a file, to
file away any plastic in the way.

From: hrs@aber.ac.uk
Message-ID: <1992Mar25.141336.26921@aber.ac.uk>
Source record: 44951

Now that Atari UK have dropped their prices for the TT (perhaps under a
1000 pounds for a TT/2 (no HD or Monitor though)) I am toying with the idea
of buying one. Before I do that I wonder if anyone knows the
answer to this question.

What is the state of memory in the various TT configuration, i.e
TT/2, TT/4 etc. Is this memory ST RAM? (I guess it must be) and can
one upgrade the memory simply by plugging in SIMMS (as with the STe)?

I see little point in buying a TT unless I can upgrade.

>Just how do folks in Germany interface via token-ring or Ethernet?
>I have a Mega2 if it makes any difference.

We have at least two 'companies' in Germany (Biodata & PamSoft), both of which try to make products that would fill your (our) needs. So far they have not been satisfactory successfull. I spent lots of time and money to both, even provided sources & technical support, but still there is not a product to recommend. Do not believe in advertisement that states the contrary! Most of the so-called 'running' networks are island-solutions or imply very starnge setups with lots of constraints on the St side. The customer support as at atari level or below (if at all possible). Besides, it is nowadays less expensive to buy a 386 PC with network card and working software than to buy the St net-adapters alone!!!

Sorry to disappoint you, but reality is sometimes crude..

Source record: 44957

I've noticed that most of the MiNT specific utilities work very
well under MGR, and since they appear to be fairly simple ports
of unix utilities... I have hopes of porting (or using other peoples
ports of) unix applications.

Witness that less, ps, vi, emacs all work well, and you'll see my hopes.

Anyhow, I do use a lot of non-mint-specific .TTP utilities, and they
do run okay in the background using mint. I can run Flash in the forground
under mint (but not under mgr) and that's about the best I've done lately in
the way of combining background tasks with forground tasks. What I'd really
like to see is a vt100 terminal in a window under MGR... and hope to find one
soon! When I do, I'll leave it logged into the mainframe where I can see it
(in the corner of a big screen) and use the remainder of the screen for
local utilities!

What I'd really like is a multiple window, packetizing terminal program
that would allow me to have multiple sessions with the mainframe here...
but that's a pipe dream I suppose.

Anyhow, a big screen, and spare clock cycles will help... and I can
take care of those two items. So I'm shopping for Speed and Resolution!!!

Seeya!

1255. Mouse/Joystick switch for ST

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-25 21:38:42 UTC
From: bb693@cleveland.Freenet.Edu
Message-ID: <1992Mar25.213842.22187@usenet.ins.cwru.edu>
Source record: 44960

Like all students, I need some cash, and like all (?) Atari users, I have to cope with Atari's stupidity in locating the joy/mouse ports. Having solved this problem myself by building my own switch, I would like to start making and selling this switch. I will fully guarantee my product or I will replace it for you for free. But before I start buying the necessary components, I would like to get a rough idea of the potential market. At a VERY rough estimate I will offer the switch at a price of $9.00-$11.00, plus shipping. But as I said this is a rough estimate and may go up or down slightly Please e-mail me to tell me if you're interested, BUT NOT TO ORDER, for now I just need to know how many people are interested.

The switch I envision connects to the mouse/joy port, with about 12-16 inches of 9-wire cable which goes into a small box which holds the switch and two sockets, one for the mouse and the other for the joystick. I will be using 9-wire cable, so theoritically the switch should work with other devices connected to the ports, but i will NOT guarantee that, since I have tested it only with a mouse and a joystick.
However, if anyone would like some other configuration, such as more sockets, I can do that too, but I will have to get back to you about the price since a different configuration would cost me a different amount.

Later!

Hello. Well it seems my Mega is slowly healing itself. Just lately it has
been booting first try.

I have had 2 STEs die on me. In both cases I had put 4meg of simms in the
machines. It could be possible that the RAM was some sort of high drain
simms that wore out the power supplies. The broken machine symptoms were as
follows: power light goes on (I think), but the floppy never tries to spin
up. Either that, or I am a natural at killing computers.

as spake by cummins@a.cs.okstate.edu (CUMMINS JOHN WILLI) :
>Witness that less, ps, vi, emacs all work well [under MiNT?] [...]
^^

Hello? What's this? Are you implying the existence of a MiNT-aware vi?
One that, for instance, would allow one to run external programs from within vi
using the ! command? That would be soooo useful.

I'm still looking for a good vi. I've tried most of the versions on a.a, and
so far STeVIe v3.9 seems the best (though it still crashes annoyingly often,
and has a few other bugs).

I believe that the only thing that's different is the *shape* of the eject
button. On new disks it's rectangular, on original ones, it's trapezoidal. A
small file should do the trick.

From: elendir@pegase.enst.fr
Message-ID: <1914@pegase.enst.fr>
Source record: 44967

Well, let's take a 40 MHz 68030 doing normal memory accesses (that is,
asynchronous ones, 3 cycles needed).
I have not here the electrical specifications, but I still can remember
that the data is latched on the beginning of the third cycle.
Given that the address is not valid after the first half-cycle, this lets
1.5 cycle for decoding and giving data.

1.5 cycle @ 40 MHz is 37 ns, and 30 @ 50 Mhz.

Obviously, this is impossible for normal DRAMs. The fastest aviable are 60 ns
access time. Meaning you'll have to insert at least one wait state.

Two for a 50 MHz 030.

I don't speak about synchronous access, which takes 2 cycles to complete !
And burst access, only one !

About TT : TT/2 TT/4 have only STRAM
TT/6 TT/8 have 4 Mb TT-Ram and the rest ST-Ram

There is no simple upgrade, you must buy Atari card, or something equivalent.

Enjoy,
Vincent.

>Thanks muchly.
>dave allen, colorado springs

I'v done some experiments on refilling the cartridges. I use ordinary pen ink (available in many colors !). To refill the cartridge, I use an injection needle (40 * 0.8 mm), to inject the ink in the little hole on top of the cartridge. You've got te beware of pushing the needle too far into the cartridge. About 4 to 6 cc of ink will do the job. I refilled my first cartridge about ten times now. About this time you can see the quality of the print-outs is going worse. I also experimented with colored ink to make a multi-color print-out. The disadvantage of not using the original ink is, that the original ink is water-resistent, and the ink I use is not. However, I've seen refill-packages to refill the cartridge 2 times with water-resitent ink. In Holland this cost about fl 50,- (about $25 I think). When you use ordinary pen ink and an injection neeedle, it's gonna cost yoy about $3 (fl 6,-). Quite a difference for a student.....

MultiTOS truly is based on MiNT (Atari showed it at CEbit, so I'm allowed
to say that much now :-)). Not every feature of MiNT will necessarily
appear in MultiTOS, and vice-versa; but it might not be unreasonable to
suppose that MultiTOS will have some sort of installable file systems.

> The real bottleneck is that the AES and application software assume
> the 8+3 filename format and the backslash path delimiter.

Exactly. Actually, the backslash isn't so much of a problem (it's easy enough
to convert / <-> \) but all the existing applications that think that
all files have 8+3 uppercase names are going to be a real pain.

I should emphasize here that all of the above are my opinions only.
What Atari does with its operating system is its business, not mine,
and I cannot speak for them.

>there earlier, so when they live infinitely, dos still will be older...)

I don't care what system will have lived longer when it finally dies. My
point is, for MSDOS there is no space left for further development, whereas
MultiTOS is a most obvious demonstration that further development of TOS
is possible and in progress. Given these facts, I think that MSDOS has less
future as a live OS than TOS. Of course, it will not disappear suddenly
because of those innumerable applications running under MSDOS, but this
does not change the fact that MSDOS is basically outdated.

<stuff deleted>

Ever tried to set up one with Signum? :-) Really: From what I hear, prices
for Mega STe's are about the same as for 386DX clones, and standard software
for STs is generally less expensive than for MSDOS, and of better quality

at the same time.

>In my opinion a TT with 200 meg
>drive & 19" screen must not cost more than, say 1500$. In our country the

>the range. As atari always has screwed up on real high-tech i hope they
>will cut prices drastically on their existing stuff to survive, otherwise
>all we'll see from them in the future is pacman,lynx & co.

Of course, I'd love it too if Atari could cut their prices drastically,
so I can afford a nice TT and an ST book for travelling ... However, I
don't think that Atari computers are really overpriced, but they are
undersupported, especially by the software houses (I've speculated
about the reasons for this in my first posting).
As for Atri's future, I'd say their hardware seems ok, their OS looks fine,
but of course, the future of a system also depends on what software there
is available for it. And this is where the problems for the future of
Atari come from.

1267. TinyTurbo30 vs. SST

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-26 16:21:24 UTC
From: bcc@Eyring.COM
Message-ID: <1992Mar26.162124.2189@Eyring.COM>
Source record: 44972

The first issue of Atari Advantage came yesterday, with reviews and ads for both the SST and the TinyTurbo30. Has anybody thrown together a side by side comparison of the two?

Price: The SST has a range of prices, depending on how much the board is populated -- low end is $599 (sounds like bare board -- do you get a CPU at that price?) while the high end is over $1000. Anybody got a list of complete prices? The TinyTurbo30 (TT30) seems only to have one price, plus two options (68882, virtual memory). Consequently, the entry level price of the SST ($599) is lower than the entry level of the TT30 ($999) but the TT30 has an introductory offer good for a month putting it at $599 also.

Installation: The SST simply says 'Technical installation, dealer installation recommended'. Does it plug into the Mega expansion slot, or replace the CPU? The TT30 is also rather vague on installation, but indicates that some desoldering is required -- I assume that it replaces the CPU chip. Ok for those that have a 68000 already socketed, bummer for the rest. This must also mean different models for different boxes -- don't some of the latest machines have Pin Grid Array packages instead of Dual Inline Packages? Do any use Surface Mount?

Compatibility: The SST is only for the Mega -- apparently it is fairly large. The TT30 promotes the tiny size of the card (about 3 x 4 inches) and claims to go into anything from 520's to TT's. The TT30 also has a regular 8 Mhz 68000 on board so that it can run programs that use the MOVE SR,D0 instruction. Both come with Tos 2.06.

Memory: The SST comes with additional memory -- up to 12 Meg, and requires (?) that your Mega be fully populated w/ 4 Meg of base RAM. Considering that it is getting more and more difficult to get by with a puny half-meg, or even 2 meg, this doesn't seem too bad, but... The TT30 doesn't add memory, but has a virtual memory option (at $299 more) that makes disk space look like RAM -- up to 128M!

Speed: The SST brags of being up to 12 times faster than the stock Mega, the TT30 only claims a 6-fold speed increase. I gather that the extra factor of 2 speed on the SST comes from running out of the new memory, which isn't dual-ported into the video RAM and thus avoids a wait state.

Problem: I don't have the article in front of me as I type this, so I could have fuzzed out on some of the details, or gotten them completely wrong. Could someone fill in a few of the specifics -- i.e. just how is the installation of each one performed? There are no dealers within convenient distance from me, so I'd be on my own for either one; and just how slow would that virtual memory option end up being? It would be nice to see some timing

figures on monster programs, like the gnu C compiler compiling itself, for instance. Anyone want to give it a shot?

1270. memcpy bug (dLibs 1.2 / Sozobon 1.33i)

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-26 19:08:08 UTC
From: gavin@praxis.co.uk
Message-ID: <1992Mar26.190808.19220@praxis.co.uk>
Source record: 44975

I have discovered what seems to be a bug in the implementation of memcpy in dLibs 1.2. The version I am using is the one that comes with Sozobon C 1.33i (the "Heat and Serve" release).

As far as I have been able to narrow it down, the fault is that memcpy sometimes fails to copy the full number of bytes requested, depending on whether the source address is word-aligned.
I can reproduce the problem with the following example program, which simply calls memcpy repeatedly to copy 10 bytes at a time from a series of consecutive addresses:

```
char *src = "01234567890123456789";
char buff[11];

main()
{ int i;
for (i=0; i<8; i++)
{ strcpy(buff, "XXXXXXXXXX");
memcpy(buff, src+i, 10);
printf("i=%d, buff='%s'\n", i, buff);
}
}
```

When run, this produces the following output:

```
i=0, buff='01234567XX'
i=1, buff='1234567890'
i=2, buff='23456789XX'
i=3, buff='3456789012'
i=4, buff='45678901XX'
i=5, buff='5678901234'
i=6, buff='67890123XX'
i=7, buff='7890123456'
```

Cases i=1,3,5,7 show the correct behaviour, but for the cases i=0,2,4,6, only 8 bytes appear to get copied instead of 10 (the last two X's don't get overwritten).

Is this a known problem and if so is there a fix available?

I think the question here is, how does the TT determine how many wait-
states are needed, if at all? Does it automatically assume it needs four (I
would guess from the above info) wait-states, so that it will always work for
synchronous access from 80ns (or whatever is MININUM for the TT) RAM? Or does
the TT intelligently select wait-states? I.E.: if you have 30 ns RAM (say a
memory board with on-board cache), will it latch the data at 0 waitstates
(asychronus, 2 waitstates burst)?
So can anyone comment on how the TT's CPU perceives it's memory, and
how well it can adapt to different RAM?

My hard drive just broke, its a supradrive 20 meg atari hard drive. I called Supra and they dont make these anymore and said I would have to spend $325 to trade it in for a 52 meg. So my question is, does anyone know of a cheaper way? I dont need 52 megs, 20 was more then enough. Are PC drives cheaper and can they be connected to the atari? Does anyone have a drive they want to sell for less then that? Would a 52 meg drive cost me more then 325 in a store? Also, anyone from the Bay Area, where can you buy atari drives? (I'm in Santa Cruz, and there's no where here.)

thanks, Liz

^^^^^^^

I have recently come across this problem with an STE I borrowed. The problem seems to be in the power up reset circuitry. I haven't (as yet) dug out the circuits to check this hypothesis, but it also seems to be voltage sensitive. I was fooling around with some hardware hanging off the cartridge port and had to wind the voltage up a shade to compensate for a bit more load on the 5V rail. On the STE main board I wound the voltage from 4.77V to 5.00V and the problem was there just about every time I turned the machine on. Hit the reset button and the machine decided to boot. Perhaps the PUR pulse is not long enough? Anyhow I wound the volts back down to 4.80V and it now works a lot better, although the problem is still there. I hope to check out the circuits later this weekend and post any findings.

Sla/n go fo/ill,
Risky B.

1278. Making the screen one line shorter (at the bottom) -- How?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-27 09:00:34 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <NVeaiB1w164w@ersys.edmonton.ab.ca>
Source record: 44983
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi. I wrote a terminal program for the ST a while back called DataLink. I am now re-writing it (still in Personal Pascal) and I would like to improve it. One of the improvements I would like to make is a status bar at the bottom of the terminal screen that shows information about what the program is doing, how it is set up, time online, etc. There are two ways I could do this:

1. Keep track of the incomming data, and actually scroll the screen myself when the data reaches the bottom. This is not the preferred way since it would slow the system down and waste program space and memory.

2. Convince the system that the screen is one line shorter than it actually is. I've seen this done, but do not know how to do it. This has the advantage of not wasting code, not slowing down the system, and not flickering. I need to know how to do this using system calls (BIOS, XBIOS, AES, VDI, or whatever it takes.) Personal Pascal doesn't provide internal support for aline calls, though (which I have heard have something to do with it) so I would have to find a way around that.

Thanks for any help offered.

Liz Neely asks about a broken Supra hard drive...

Liz.. what is is about your drive that's broken..?

It's possible that your existing drive could be fixed, or a new 20 Meg mechanism installed in the case, for a lot less than buying a new hard drive with more capacity than you really want.

If you don't have the technical experience to work on the drive, or know anyone close by, you could contact the Bay Area Atari Users Group and see if anyone there could help you.

Their BBS number is: (408) 986-0215 and their contact person is Joe Fischer at: (408) 988-3065

BAAUG meets the first Monday of each month in Santa Clara.. it might be worth a drive out there if someone can help you get your hard drive up and running again...

(Plus, if you join the group, you get a subscription to Atari Interface magazine, which is where I found this info... :)

unfortunately, TurboC is not supported anymore. Borland has dropped all
activities for non-Messy-Dos-machines. I'm afraid the only chance for
you is to buy PureC, which does have FSM-GDOS support (according to the
update informations, I do not have FSM, so I'm not able to test it).

> synchronous access from 80ns (or whatever is MININUM for the TT) RAM? Or does
> the TT intelligently select wait-states? I.E.: if you have 30 ns RAM (say a
> memory board with on-board cache), will it latch the data at 0 waitstates

Well, I guess there is no choice for ST-Ram. The timing is "harware-enforced"
by the TT-MMU or whatever custom chip which generates the DTACK (TT-SCU ?)
Furthermore, I believe that ST-Ram speed is 120 ns... And, anyway, the 030
is restricted to access ST-Ram every other 250 ns slice, because of the shifter
bandwidth.
Regarding the TT-Ram, this is, I think, selectable by a jumper on the card.
However, there is no such thing like an automatic timing selector. It's the
embedded custom chip which generates DTACK. If you build your own card, and
want to plug it in place of TT-Ram, you can select whatever timing you like.
No on-board custom will hinder you.
Caching can be done by replacing the daughter-board baering the 030 by one
of your own design, if you have an old TT. If you have the newer ones, with
030 on the mother board, let's say it's much more difficult !

SST is fast because it has its own memory and memory controler. Thus, the
timings are fully fitting memory speed.

Well, hope this will be useful.

Enjoy,
Vince.

1283. ftp -> atari via pc clone: How ?

Newsgroup: comp.sys.atari.st.tech

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi Guys and Gals,

I've spent the last two days ftp'ing stuff onto our unix (ultrix actually) machine here at une and then copied the files across to atari formatted discs inserted into a pc clone. I took them home to my atari (mega2st) and tried to un-arc them and my version of arc didn't want to know about them. I think I have v5.0 (or there abouts).

The question is, is there anything that I may not be doing or that I may be doing wrong (I am setting all the various file types for transfer to binary, could this be the problem?)?

e-mail responses gratefully accepted although I do read these groups regurlarly.

Thanks again,

Shane.

My MEGA ST2 has never had any quirk about staring up untill I bought a
Harddrive (a megafile 44). I have had this computer for 3 years untill I bought
the HD so I am convinced it has something to do with the HD.
It will only boot after I reset (button) the computer, NEVER straight after
power-on (no matter how long I wait after switching on the HD and waiting
for the green light (=LED)).

>
[Concise description of bug omitted]

I'm afraid I canot help with an answer to the bug (obvious solution is
to whip up your own assembler library alternative - should take all of 3
minutes)... BUT I too have experienced a problem with dLibs.

The 'strdup' function, which I use a lot, when tested in a little program
NEVER EVER used malloc to grap less that 16385 bytes!

EG

```
char *another;

printf("Memory free: %ld\n",malloc(-1L));
another = strdup("This is a string");
printf("Memory free %ld\n",malloc(-1L));
```

reported two memory frees, the second being over 16k less than the first.

Any comments? I resorted to simply doing it the long way round.
EG

```
another = (char *)malloc((long)strlen(original_string)+1);
strcpy(another,original_string);
```

-- In case I made a dumb typo error in the above, assume that I am making
the relevant function calls correctly....

At one point, I ended up with an implementation of a history list that
snaffled 16k per command, regardless of length ....

1287. Need help with new 1040STe

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-27 14:56:34 UTC
From: automan@milton.u.washington.edu
Message-ID: <1992Mar27.145634.29817@u.washington.edu>
Source record: 45042
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Dear Net-Gods:

I have been following most of the threads here for the last several months. Even though I have owned an Atari ST now since it was first introduced, I have recently purchased a 1040STe. At the moment, it is merely a STOCK machine, but I have had a few problems/questions. If these are FAQs, please bear with me:

#1. I have some trouble running older entertainment type software on this new system (ie. StarGlider). For some reason, it will not go any further than the opening screen. The version of TOS is unknown to me except that I am sure it is "Rainbow TOS". I have yet had the time to experiment with many other titles but was wondering if this is normal and if so, if there is a quick fix.

#2. Some of the files I have FTP'ed and then downladed have an extension of TAR.Z. All references I can find in UNIX on this describe it as a tape utility. How can I uncompress this?

#3. I am considering obtaining the necessary hardware to allow my ST to run IBM software. I have considered the following items:
-PC Ditto II (quoted at $199)
-Spectre (quoted at $299)
-Turbo Charger? (quoted at $500)

If anyone could comment on thier experiences with these items, or better prices and where I might obtain them, please let me know. Also, am not familiar with the features peculiar to each item.

#4. (Lengthy, ain't I?) I have a HP-48sx calculator and would like to be able to transfer programs to it via a cable. Those have this model calculator and an ST probably know what I am talking about. I have the cable, but am still having problems. Can you recommend a kermit package, etc? Any help would be appreciated.

Well, that's it for now (I know, most of you are thinking "THANK GOD!). I thank you for your help in advance.

1288. Interrupting programs under MiNT

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-27 15:40:09 UTC
From: HAC041@DJUKFA11.BITNET
Message-ID: <92087.154009HAC041@DJUKFA11.BITNET>
Source record: 45043

From the MiNT documentation I conclude that it is possible to interrupt
a program by typing Control-C even if the program is not reading data from
the terminal. At least this is supposed to work with programs using "cooked"
I/O. This already seems somewhat odd, after all the program is supposed
to be interrupted while not doing I/O at all. Anyway I could not get
anything like that to work.

To be specific, let's take an example program:

```
void main(void)
{
while (1);
}
```

Obviously this program runs in an infinite loop without doing I/O. Now
for the question: what must I add to this program to make it interruptible
by typing Control-C as under Unix?

Pure C (feb92) comes with bindings for FSMGDOS. The online help manual contains
information about calling and parameters. The manuals haven't been upgraded,
to cover this subject.
The description of the bezier curve and polygon functions are a bit thin!

Have anyone figured out what the parameters are used for?

>>>>> Roger.Sheppard@bbs.actrix.gen.nz adds:

Roger> Some one told me that a Volume name can be added any time..??
Roger> or is this why the STCAT50 program fails..??

Yes, any time! True again, this is one of the problems that STDCAT50
has with volume labels. I'd suggest STDCAT43 which does this just
fine.

Now a question for *all* you ST gurus out there (and MS-DOS gurus,
too):

What is the correct definition of the 11 character volume name? Is
there an implicit dot (.) between the 8th and 9th characters like
files? Are lowercase letters allowed? Is an explict dot (.) allowed?
I have a floppy with the label "GEM.010" with an explicit dot!

I've noticed that different software read the above label differently.

Any comments?

From: pm@fortec.tuwien.ac.at
Message-ID: <pm.701716980@fortec.tuwien.ac.at>
Source record: 45047

Hello,

some time ago we purchased a "Riebl-Card plus" ethernet card from Atari
to connect our Mega-ST to our LAN.
As we couldn't find convenient software to communicate to our Suns we
started to write our own. Meanwhile we have adapted it to be compatible
to the Atari ANS TCP/IP specifications.

Our software package currently includes
- a multi window telnet program
- a ftp server program, both useable as .ACC or .PRG
- an ANS compatible TCP/IP protocol stack
- an ethernet driver for Atari Riebl-Card plus

Anybody interested in this stuff drop me a mail.

>to say that much now :-)). Not every feature of MiNT will necessarily
>appear in MultiTOS, and vice-versa; but it might not be unreasonable to
>suppose that MultiTOS will have some sort of installable file systems.
The thing with installable file systems is nice, but I consider this
(up till now) only a 'personal fix'. Assuming that I am a distributing
software, I'd assume that the default filesystem STILL to be GEMDOS.
And if GEMDOS has this 11 character limit, I can't see how you
can conveniently use long filenames 'outside' your computer.

Of course if at one time GEMDOS would be officially replaced by an alternative
filesystem, (being the "most obvious solution" from my orig. article),
I'd be more than happy, but I (somehow (har)) feel that this won't be the case
very soon.

Personally I believe (now), that having a filename translation table, is
probably the best (and easiest) way to go (at least for my programs). This
way one can optionally translate the filenames, to longer ones, and best of
all this is independent of GEMDOS at all. (A lot like Space Quest for this
matter...)

Thanks for the many reponses (also by Email)

1294. Mouse/Joystick switch for ST

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-27 17:44:59 UTC
From: bb693@cleveland.Freenet.Edu
Message-ID: <1992Mar27.174459.15564@usenet.ins.cwru.edu>
Source record: 45049

Like all students, I need some cash, and like all (?) Atari users, I have to cope with Atari's stupidity in locating the joy/mouse ports. Having solved this problem myself by building my own switch, I would like to start making and selling this switch. I will fully guarantee my product or I will replace it for you for free. But before I start buying the necessary components, I would like to get a rough idea of the potential market. At a VERY rough estimate I will offer the switch at a price of $9.00-$11.00, plus shipping. But as I said this is a rough estimate and may go up or down slightly Please e-mail me to tell me if you're interested, BUT NOT TO ORDER, for now I just need to know how many people are interested.

The switch I envision connects to the mouse/joy port, with about 12-16 inches of 9-wire cable which goes into a small box which holds the switch and two sockets, one for the mouse and the other for the joystick. I will be using 9-wire cable, so theoritically the switch should work with other devices connected to the ports, but i will NOT guarantee that, since I have tested it only with a mouse and a joystick.
However, if anyone would like some other configuration, such as more sockets, I can do that too, but I will have to get back to you about the price since a different configuration would cost me a different amount.

Later!

```

A couple of points:

o malloc as defined by any standard I know, doesn't return the amount of free memory, regardless of what you pass in as a pointer.

o if it does so, it is most likely a non-portable extension

o on GEMDOS machinery, most likely the call with a negative pointer is passed to Malloc, which indeed returns the "largest block" of RAM available.

o malloc most probably is not implemented as a direct pass thru to GEMDOSs' Malloc, but instead does it's own memory allocation scheme, that uses Malloc. So that if your mallocing the first time, malloc Mallocs itself a suitable block (apparently ~16K).

Try this:

```
unsigned long x;

strdup("This is a string");
x = malloc(-1L);
```

```
strdup("This is another string");
if( x != malloc( -1L))
puts("You have indeed a problem");
/* In this case, use this little ditty (or some such):

char *nstrdup( s) /* untested... written on the fly (nat/92) */
char *s;
{
char *t;

if( t = malloc( strlen( s) + 1))
strcpy( t, s);
return( t);
}
*/
else
puts("All's well apparently");

Hope this helps...

For my communications system, I wrote my own screen driver in C for managing windows. Works fine with a stripped down TOS 1.0 machine.

Actually, with all the rig a marole' TOS 1.0 text output is bad, but not bad enough to resort to ASM for serial applications.

Its also quite portable between TOS's too.

If you would like a discussion on it, email me.

I might even be gracious enough to show you how to do ANSI.

>
>2. Convince the system that the screen is one line shorter than it

>internal support for aline calls, though (which I have heard have
>something to do with it) so I would have to find a way around that.

You could write a Vblank driver...but why? By the time you do that, you could already have your own screen driver, which you are going to have to write anyway if you want to support more than VT52, which if you don't would make your terminal program kinda boring. Take a VACATION if you want to do it in assembly language using VBLANK drivers...

Trust me, its not as bad as it sounds.

PASCAL is NOT the way to go though in trying to do this. If you don't know C, learn it quickly. Or, learn 68K assembly and stick with PASCAL if thats your schtick.

C does make your life easier though....at least in this case...:).

> to be interrupted while not doing I/O at all.

The limitation that the program must be doing "cooked" i/o applies because some programs that use "raw" i/o (e.g. the BIOS Bconin function) rely on being able to read Control-C.

> void main(void)
> {
> while (1);
> }

> Obviously this program runs in an infinite loop without doing I/O. Now
> for the question: what must I add to this program to make it interruptible
> by typing Control-C as under Unix?

This program will be interruptible by typing Control-C when started from a shell like tcsh that sets the terminal into cooked mode. Or, you could do this in your program with the appropriate series of Fcntl calls.
Or, you could print a short message using a GEMDOS function like Cconws that is interruptible; this will switch the terminal into cooked mode.
(Do this before the "while" loop.)

Or, you could use Alt-Control-C, which will always interrupt even in raw mode.

1299. Poor Quick Index ratings on my TT with TOS 3.01...why?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-28 09:58:24 UTC
From: genius@sys6626.bison.mb.ca
Message-ID: <2RHciB2w164w@sys6626.bison.mb.ca>
Source record: 45054

I recently ran Quick index on my TT030/4 (4MB ST-RAM only) with TOS 3.01.
Without the screen accelerator Quick ST3 or any other accelerator for
that matter installed, I get these results:

TOS text : 44%
TOS string: 49%
TOS scroll: 18%
Dialog box: 66%

These are all with the 'TT' button selected and in TT medium with the
'med' button selected in QIndex. Why am I getting such poor results?
Since I'm using a TT, shouldn't those be all at 100%??? All the other
tests on my TT come out around the 100% mark, so how come all the TOS and
GEM tests rate so poorly? Is this some 'bug' in TOS 3.01 that gives me
these numbers? Has anyone gotten the same results, or is my machine a
mutant? Thanks for any help.

1300. Floppy drive pulse on the TT

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-28 10:04:03 UTC
From: genius@sys6626.bison.mb.ca
Message-ID: <g2HciB3w164w@sys6626.bison.mb.ca>
Source record: 45055

The other day, I ran the various floppy drive rpm checking programs on my TT (TOS 3.01, 720k drive). One of them bombed out. The other put the drive light on for a second and then gave me an alert saying 'no drive pulse' and Quick Index just bombs if I try the rpm test. Besides this, my drive seems to work great and I've never had problems with it. Why do these programs crash or give me errors? Also, how come if the light on my floppy jitters on and off very faintly (only really noticable in the dark) even when the drive's not being used? Another annoyance is that when using the RCA audio out jacks hooked up to a stereo, the TT emits a noise on the line which is really annoying, especially noticable if I turn the stereo up loud. The noise seems to get worse the more white that's on the screen. I have Atari's PTC1426 color monitor which is mounted on top of my TT, is that what's causing the problem, or is it internal electrical noise in the TT? Thanks for any help.

...some more lines deleted...

The 256 kbit DRAM chips in my 1040 STf are 150 ns types and the machine
works fine with them. I have never seen slower chips of similar capacity;
anything whould work in an ordinary ST.

I use a trick that jwahar bammi (bammi@cadence.com (rather old address) or 71515.155@compuserve.com) posted many years ago which changes the total lines the system sees by altering a value in the aline structure. This is likely not legal, but it has worked for me ��without problems on a ST. I don't have the code handy but believe the value is V_CEL_MY in the aline.h file he distributed (max Y cells -1).

1304. Mega STE problems

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-28 18:21:21 UTC
From: cbillows@sys6626.bison.mb.ca
Message-ID: <a35ciB1w164w@sys6626.bison.mb.ca>
Source record: 45059

Greeting everybody,
I have just purchased an Mega 2 STE/50 meg HD. It comes with TOS 2.05.
I'm experiencing some compatablilty problems and some hardware ones as
well.

I have games such as Lemmings, Wayne Gretzky Hockey and Dungeon Master
that do not work with this machine...yet I've been told from local
sources that this computer is *more* compatible software-wise than the
1040STE (TOS 1.6) Does anyone know or experienced software problems?
Which programs? Is there anything we can do?

As far as hardware goes I've experienced times where the Mega refuses to
acknowledge Drives A and B. It seems to happen after I've rebooted the
system a couple of times with floppies in the drive. It does'nt happen
when I initially boot up but once this happens I am forced to shut down
the machine to correct the problem. Has anybody had this problem?
As well certain software packages such as Barbarian, and Populous I've
experienced problems with the screen being shifted over. What happens is
the display is moved over to the right of the screen which then wraps
around to the left side. This only happens for certain programs yet
others tell me that they have'nt experienced such problems.

Finally I have a program that is supposed to allow for STs with higher
versions of TOS to emulate a 1040 ST (TOS 1.4). The problem is that it is
not executable but has a *.IMG extension. I've been told that the
computer will look for such a program and then load it in and vola! you
have a TOS 1.4 machine. Yet this has'nt happened since I know of no way
to have the machine read an unexecutable file. Does anybody else have
this program (Mine is called RAM_TOS.IMG) and do you know how to use it?

Any information or support regarding the above questions will be greatly
appreciated...

Thanks in advance.

From: rdo@sys6626.bison.mb.ca
Message-ID: <TigDiB1w164w@sys6626.bison.mb.ca>
Source record: 45061

A friend of mine just bought himself one of these things and has been having all kinds of grief with it. The major concern is how compatible it is with a basic 1040e. The dealer says it's "Even more compatible". My friend has experienced otherwise...

The following games don't work with it: Lemmings, Wayne Gretzky Hockey, Barbarian. There were more, but I can't remember the others.

Also, his IBM emulator (Supercharger) doesn't work. The docs say you may have to change the SCSI port address for it to work. This is not simply flipping a dip switch, it involves some soldering and he's not about to try this unless he's sure it will work. Has anyone done this?

The most annoying thing is sometimes his drive A icon from the desktop says "Drive A does not exist" when he double clicks on it.

Is a MegaSTe really this bad in terms of compatibility with 1040 stuff? He has talked with the dealer but doesn't feel satisified with the answers. Perhaps there are some MegaSTe users out there that could help enlighten us.

What about if you get TOS 2.07? Does compatibility improve?

>[...]
>Anyway I could not get anything like that to work.

This is also my observation. It seems to work only if the process is doing terminal I/O. The same goes for the sequence Ctrl-\. Hitting Ctrl-Alt-C works always, but kills ALL processes that don't catch the signal, including an eventually running window manager :-(... this is obviously not a good solution. However, you can of course interrupt the program by directly sending a signal to it, for example by using the `kill' command from a concurrently running shell.

>for the question: what must I add to this program to make it interruptible
>by typing Control-C as under Unix?

If the structure of your program allows for it, you can regularly poll the terminal, thus giving MiNT the opportunity to raise the signal (this can be done with something like "if (Cconis()) Cconin();").

From: bertram@eastman.UUCP
Message-ID: <2964@eastman.UUCP>
Source record: 45063

I have retrieved Mint 093 and the MGR binaries from a.a
I have tried running mint from the AUTO folder and letting it start
GEM and also run mint directly from the desktop using mintshel as the
INIT program. In either case I have the following problem:

I start MGR and create a window.
At some unexpected time, while using MGR, the ST freezes.
The only way to get out is to reboot.
The freeze sometimes occurs even before I create a window.

My auto programs are the tos14 fixes, lg file selector, a clock setter
the ramplus ramdisk driver, and the pyro screen saver. With the
exception of the tos14 fixes and ramdisk all others are started using a
batch STARTUP program. I have an older 520st upgraded to 2.5M of ram.

Has anyone else has this problem with mint/mgr ? Is there a solution ?

Thanks.

>
>The question is, is there anything that I may not be doing or that I may be
>doing wrong (I am setting all the various file types for transfer to binary,
>could this be the problem?)?

I don't think that the binary transfers are the problem, since binary normally
means "don't change even a bit in this file"! I think your problem is the
version of arc you use. Arc 5.0 is quite "outdated" - Arc 6.02 is the latest
officially released version. Try that one, you'll find it on a.a.u.e ...

yours,

Benedikt

This is a bug in MiNT 0.93. Obviously, it is a serious bug :-(.
MiNT 0.94 will be posted to atari.archive sometime later this week, and
will correct this bug (and some others).

If anyone was thinking of getting MiNT 0.93 but hasn't yet, wait for
a week and get 0.94 -- it will be much less buggy.

Gosh, a MegaSTE is an AWEFULLY expensive game machine. If your friend bought his ST for games, he deserves what he got.

He would have been further off in buying a SEGA system. Games are far better and so is the game play, and its not as expensive.

>

I use my Mega STE basically to write my own software. Turbo C is the only thing I usually use and Flash. Both work fine, in fact, they work excellent! If I want to do any serious personal work, I always have my Spectre GCR, which also works just ducky...

The games I have played are Jay Minter's Mutant Camels, which work very well also...SimCity works very nicely too.

>What about if you get TOS 2.07? Does compatibility improve?
>

There IS NO TOS 2.07. Anyone who tells you otherwise has been drinking too much.

Don't use your ST for games. Its the worst game machine around, and its very out of date..ie, graphics are poor. (We have had the SAME graphics capabilities since 1986 for God sake...thats 8 years!)

At this date and time, the ST/TT is a hobbyists machine, so your gonna have to write your own software.

Save your money and get a Sega system, or SuperNES, for god sakes, those systems at least have CD ROM drives...

Hell will freeze over before you get anything like that on the ST.

-Greg

Flames are of course, always welcome.

PS: I am working on the post for Think C's debugger..be patient. I lost the paper a friend gave to me with the patches on it.

1314. Attaching IBM keyboard to 520ST

1315. Gemini snatching modem output?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-30 03:39:40 UTC
From: aa384@cleveland.Freenet.Edu
Message-ID: <1992Mar30.033940.29215@usenet.ins.cwru.edu>
Source record: 45070

I've been experimenting with using dialer accessories to dial numbers, but I've had some problems which I believe have something to do with Gemini. The "ATD..." string is being printed on the desktop menu bar instead of being sent to the modem. This happens even with a clean system and does not happen on the standard desktop. If I exit Gemini, the dialer accessories will work, but they will not work within programs run from Gemini. I've seen this happen with at least 2 different accessories and I think the same thing happened with a window terminal.

I was wondering if Gemini (1.21 UK) was intercepting OS calls or something and sending the string to the wrong place?

The Point: Has anyone had a similar problem, and is there any way to fix this?

Get the Mac Classic II with the educational discount. You'll be able to make most of the money back from the programming if you are getting paid.

Problems with GCR as Mac programming environment:

* Crashes. Crashes are common enough with regular (and irregular) programming environments, problems add up when you throw the Spectre into the mix.

* GCR will gobble up hard disk space.

* The Classic II is faster, for faster compiles etc.

Yes you CAN hook up any ST to a multisync, the TT will plug right into a standard one, with the ST's or STe's you need an interface box. Toad Computers, for example can sell you a multisync box to hook up a VGA monitor (are VGA and Multisync the same? I think you need a true multisync), then you can run all three resolutions on the same monitor.

From an Atari brochure, the TT is rated at 7 or 8 MIPS, and I think between
1-2 MFLOPS, I don't have it right in front of me so I don't know the exact
numbers, but you get the general range...

```

Meanwhile I have found out what caused my original problems. In fact all the methods quoted above work, as long as programs are started from a 'normal' shell. Only when running a shell under MW (as I normally do) there are some difficulties, which however are to be expected from the way MW works. The worst 'feature' is that Ctrl-Alt-C actually kills MW, which is normally not what I want.
The best solution probably would be to have a special menu item in MW to send SIGINT to the process running in the currently active window.

From: elendir@pegase.enst.fr
Message-ID: <1925@pegase.enst.fr>
Source record: 45079

Well, some answers...

[Memory and 150 ns DRAM]

Well, on a NORMAL ST (ie ST(e), but not TT), the custom chips are designed to run at 8 MHz. But on the TT, they are sped up to 16 MHz. That explains why the 150 ns DRAM do not fit anymore. This is mainly a shifter request, but also the MMU relies on it.

[Disk testers]

I found also that many disk testers bombed on my TT. I suppose this is an interrupt problem. The WD 1772 is able to interrupt the processor each time it detects the index pulse, thereby giving the rotation speed. However, this is an undocumented (by Atari) trick, and may be working differently on ST and TT. There can be also some problems due to the 32 bits address. I don't remember exactly, but I think the PMMU redirects area $00ff8xxx towards $ffff8xxx. But what is sure is that the PMMU doesn't make any redirection if address is $yyff8xxx where yy is not zero. Most of the time this results in a bus error.
Regarding the drive LED which flashes, this is absolutely normal. The system has a routine in the VBL queue which polls the write-protect opto-system to detect if a disk has been inserted or removed. That's the way media change is implemented. A side effect of this is the flashing of the front LED.

[About the Falcon (Sparrow)]

Atari France has announced the new system for April, available to developers. We ought to receive a proto at the newspaper headquarters, and as soon as we get more infos, I'll post them.

Enjoy,

Vincent --- From french magazine STMAG.

>to cover this subject.
>The description of the bezier curve and polygon functions are a bit thin!

>Have anyone figured out what the parameters are used for?

>-Klaus

Pure C does indeed come with bindings for FSMGDOS, and I have tried to
use them in my drawing program. Unfortunately there is a bug in the
bindings of v_bez() and v_bez_fill(): it does not pass the 'labels' array
(see below) correctly. It does, in fact, do the byte swapping mentioned
in an other posting, but it then passes an entirely different array to
VDI. I was quite amazed about this bug, because this is
the first serious bug I have ever encountered in Turbo/Pure C.

I have written my own bindings for these two functions, similar to the
bindings shown in a previous posting (including the byte swapping), and
now everything seems to work, although I have had a series of unexplained
crashes lately. They may have a different cause, however.

The information that is given about v_bez() in Pure C is almost exactly the
information given to developers, and is, in fact sufficient. I'll try an
explanation:

DISCLAIMER: This is not official, it is just what I have found out through
experimentation.

Each pair of coordinates you pass to v_bez() (and v_bez_fill()) has
a byte 'label' associated with it in a seperate array.
This label indicates what sort of curve must be drawn next.
If you want to draw a Bezier spline, you must specify (in that order)
a starting point, two control points and an end point.
The starting point must be 'labeled' with '1',
and the two control points may have arbitrary labels.
If you want to draw a straight line, you must specify the end
point, and label the start point with '0'.
If you want to have a 'jump' point you must specify an end point,
and label the start point with '2'.
For filled curves, only those areas are filled that are reached
with an odd number of edge crossings, similar to 'eofill' in
PostScript.

Many thanks to all those who responded regarding connecting SCSI HDs and Tape Drives to the ST. Concensus is that HDs are no problem - Power Computing backed this up by saying that their adaptor (they sell ICD) will drive any SCSI HD. As far as Tape drives go, nobody is too sure, although there is supposedly some PD driver software being uploaded to a.a pretty soon.
I'll let you know how it goes when I get time to try it all out.

Jas.

On the Atari, passing Malloc -1L is the standard and documented way of
establishing the largest free block of memory.

>o if it does so, it is most likely a non-portable extension
>
Perhaps externally to the ST, but I only used the feature of passing it
a negative longword in order to see what sort of memory STRDUP was using.
I dont actually use -1L in the application program I'm writing.

>o on GEMDOS machinery, most likely the call with a negative pointer
> is passed to Malloc, which indeed returns the "largest block" of
> RAM available.

A -1L passed to Malloc in GEMDOS simply returns the largest single free
block size.

>
>o malloc most probably is not implemented as a direct pass thru
> to GEMDOSs' Malloc, but instead does it's own memory allocation
> scheme, that uses Malloc. So that if your mallocing the first time,
> malloc Mallocs itself a suitable block (apparently ~16K).

I checked this out. No go. Malloc(x) is a macro. Its expanded to

gemdos(0x48,x)

which is a direct gemdos call.

>--
>Email: wallmann@backus.pu.informatik.th-darmstadt.de

Thanks for the suggestions! But strdup still doesnt work. :-(
So I wrote my own in Devpac, and assembled it to a .o lib file.
No problems now.

Still.. annoying while it lasted.

I am looking for an auto folder program called turbocts.prg. It basically "fixes" hardware flow control in TOS for use with 9600 baud and greater modems (to my understanding). Now that I have such a beast, I would like the program (I had it at some point, and got rid of it :-( ). It is pd or shareware.

If you have any pointers to this program, please email or post. I asked about this once before and got zero response.

Thanks in advance.

Gemini uses standard handle 2 as stderr (as most modern shells do). This means that you can't use GEMDOS calls to handle 2 to access the serial port. Check the manual pages for references about 'STDERR'.

On the ST, the volume name is just like any other filename : 8 characters and 3 character extensions. However, on the disk, the dot is never written (This applies to all files, not just volume labels), and so you find the 11 chars right after one another. Whether or not your program decides to place a dot is of no real importance, but the correct way is to put it in.

You could use the Line-A to do this (I have done in the past) but to make the program compatible with the TT I wouldn't. I suggest you allocate some RAM for a screen + 1 text line + allignment. Use Setscreen to set the physical screen to show the last 25 lines but set the logical screen to point to the first 25 lines. That way the top 24 lines will be scrolled. When you want to alter the sysline set the logical screen to the last 25 lines, write to the last line then restore the logical screenbase to the first 25 lines again.

> small file should do the trick.

yep, the case hacking was easy- its amazing how soft that case really is!
The *real* hassle is the power cable- its too bloody short!

The instruction manual says that older sts have a small board attached to the
drive. This is to allow the two rows of pins to mate with the one row of
pins on the st drive. HOWEVER, I have a small board attached, but it has
two rows on both sides! The manual says that the board is not needed, but is that
only for the version with one row of pins?

Does anyone know the basic facts about this "best of the best" TOS upgrade, hence installable into any ST nowadays? I need to know a few things about it before considering buying it...

1) Does it do away with all those AUTO folder "patches" that fix bugs in that particular TOS version?
2) If not, what patches are required for it?
3) What does it improve overall on the ST? Speed? I/O? Screen Display?
4) Is it worth getting?

Please reply in Email to: jared@midiline.la.ca.us

Thank you

>Get the Mac Classic II with the educational discount. You'll be able to make
>most of the money back from the programming if you are getting paid.

NO! Get the LC with the 020 while they are on sale, they are FASTER than the Classic II with the 030 (trust me on this one, we've run NUMEROUS speed comparisons), and can be had right now fo under $1200 with 4 megs ram, 40 meg hard drive, and color monitor. DO NOT buy the Classic II, it is a piece of shit, but a used SE/30 first, but ANYTHING before a Classic, they are a total ripoff!!!!!!!! The LC with the 020 is just as fast as the LC with the 030, I don't know why, leave it to apple..... :-(

>Problems with GCR as Mac programming environment:
>
>* Crashes. Crashes are common enough with regular (and irregular) programming
>environments, problems add up when you throw the Spectre into the mix.

The GCR is very stable, I would not worry about it. Also, if what you write crashed the GCR you will know you've done something wrong :-) We have SUBSTANTIALY more crashes with REAL MACS in our lab that I used to have with my GCR.

>* GCR will gobble up hard disk space.

True, you will need hard drive space, at least 20 megs probably, more for serious work...

>* The Classic II is faster, for faster compiles etc.

The Classis II may technically BE faster, but it sure as hell does not FEEL faster. Ask anyone who uses one, it is the most incredible dog of a computer I've ever used. Makes the GCR on an 8mhz 68000 look like a speed-demon, and with a cheap accelerator board (AdSpeed or T20/25) the GCR will seem so much faster than the Classic II you won't believe it! I don't know what the hell apple did to the Classic II, but I swear it feels slower to use the a MAC+. part of this is probably System 7, "the giant April fools joke" of operating systems. And you HAVE to run 7 on the Classic II, we tried the older systems and they won't work, as Apple promised... :-(

So, in short, DON'T buy a Classic II!

Are there any US Sites with Gemini on it? Is it Mint aware as I heard at one point? Do people like it?

Have a nice one..

There is a bug in the released version of ZOO 2.1 that causes problems
while extracting archives that have entries that want to start from the
root directory (ex. /foo/foo.c as opposed to ./foo/foo.c). This may
be the problem you have run into. This bug has been fixed in the as
yet unreleased version of ZOO 2.1 Patchlevel 1 (to be released hopefully
soon but no promises).

David,

When you did your speed comparisons of the Classic II versus the 020LC, were they BOTH running 7.0.X? If the LC was running 6.0.X (7,8) then it's no wonder that it got the faster ratings as the 7.0 has a lot of overhead to deal with.
As to why Apple decided to get rid of the 020s, I am sure that it is cheaper to buy bulk 030s then to buy less 030s and then a few (expensive) 020s, even considering that the 020s are cheap because the are old. Besides, this way you get a PMMU, a (small) built-in cache, and I believe (not sure) that the 030 has optomized some of the instructions to make them a bit faster.

Just my $.0002 worth.

1341. Apple 20SC hard drive to ICD ADscsi card ??

Has anyone used the ICD ADscsi card for connecting a 20 meg Apple
SC hard drive to a 1040ST?

Its an SCSI drive and should be no problem but just thought I would
check before buying the card... eg can I get power from the drive?.. were
there any special connector problems?.. can I get the card inside the
drive case?

Don't let Greg Bug you,

It sounds like you have the DMA bug - the DMA chip is bad and needs to
be replaced by your local dealer (I think the list of symptoms are: you
should get the screen shifting when you run spectrum pictures, you get
occaisional HD curruption, and you hear static/noise when listening to sampled
sounds (through the 8bit PCM channels, not the internal speaker) - I think
thats it). You should take it to your dealer, even if that isn't it (could
be worse...).

Why should you have to remove the 030? Is there some kind of overhead introduced between the 030 and the memory module? If not, you should be able to at least take advantage of the module port where the memory plugs in, if you don't implement it on the same board as the memory - which might make more sense. But doesn't that sound neat? A "cache sleeve" that plugs inbetween the mother board and the daughter board that only passes misses through to the memory board....

Hi all... just a quick question here. The other day at Hamfest.. a computer fair.. I picked up a cheap old copy of Pc Ditto 3.0. The old software version. I was playing around with it and it says you can make it boot from the hard drive, and still make the hard drive useable from Gem.

How would I go about doing this? Thanks for any info...

Well, I have also gathered infos at the CeBit, and yesturday from Atari France regarding the Falcon. Here they are :

- 68030, 20 MHz.
- TT rez, with an extended 640*480 VGA rez in 256 colors amongst 64K or 16M.
- 56001 DSP from Motorola.
- At least 4 Mb memory
- No MultiTOS at start, but it is to be introduced.
- SCSI Hard disk.
- Maybe : New chips to achieve zooming and sprite animation in hardware.

The machine should have the look of a standard 520 ST, that is *NO* separate keyboard.

The Mega STE is bound to disappear (Sorry for those who bought one).

This new machine should be released by October in France. A prototype is going to arrive at Atari France next month (?). As soon as it is arrived, I'll try to take a picture and post it somewhere.

More infos :

TT is continued till 94 when it'll be replaced by the Falcon '040.

TOS 2.07 is still not fully debugged, and Atari is unsure it'll be released.

Well, enjoy,

Vincent.

This won't work with most add-on graphics cards. DON't mix XBIOS (Setscreen),
BIOS, GEMDOS and VDI text output stuff. This will break on many, many
configuration. There's only one obvious solution. Write an own VT52 emulator.

I contacted Atari a few days ago, and the number I used was:

1-408-744-0880

The operator (at Atari) put me through to Gail Bacani, and I found out
some information about the Developer's Package:

1. Credit Card paymenmt is not accepted. They only take checks.

2. From canada, Gail told me no tax had to be payed and the shipping and
handling would be taken care of by Atari (regular US Mail, I guess).

Can anyone who has purchased the kit (or parts of it) verify this?

This is definitely a bug. I've added it to a pile of stuff to mail off
to Ian Lepore. To fix this problem, use the memcpy.c module below, which
is modified slightly from the MiNT library.

/* from Henry Spencer's stringlib */

#define const
#include <stddef.h>
/*
* memcpy - copy bytes
*/

void *
memcpy(dst, src, size)
void * dst;
const void * src;
size_t size;
{
register char *d;
register const char *s;
register size_t n;

if (size == 0)
return(dst);

s = (const char *) src;
d = (char *) dst;
if (s <= d && s + (size-1) >= d) {
/* Overlap, must copy right-to-left. */
s += size-1;
d += size-1;
for (n = size; n > 0; n--)
*d-- = *s--;
} else
```

```
for (n = size; n > 0; n--)
*d++ = *s++;

return(dst);
}

#if TEST

char *src = "01234567890123456789";
char buff[11];

main()
{ int i;
for (i=0; i<8; i++)
{ strcpy(buff, "XXXXXXXXXX");
memcpy(buff, src+i, 10);
printf("i=%d, buff='%s'\n", i, buff);
}
}

#endif

It's really not as much of a problem as you might think. All you need to
keep track of is the vt52 cursor's xy coordinates. The incoming data has
already been written to the screen.

> 2. Convince the system that the screen is one line shorter than it

The usual way of performing this trick is to modify some system variables
that can be found at a negative offset from the Line A parameter block
pointer (the value returned by instruction a000). This is sort of a gray
area; Atari has warned against using Line A because of potential conflict
with future video modes, but these particular system variables have worked
on all the big-monitor boards I've tried.

All you do is subtract 1 from the value stored at V_CEL_MY. It's been
awhile since I did this, but I think you have to put the 68000 in
supervisor mode first.

I don't know how you can access these variables with Personal Pascal unless
you have a copy of Tackle Box ST. You probably would be better off translating
your program to C. Here are the variables as defined in Bammi's LINEA.H
file, which is included with the MiNT library.

/* Name Offset Type Description */
/* ------------------------------------------------------------------------*/
/* V_Y_MAX -4 W Max Y pixel value of the screen */
/* V_STATUS -6 W Text Status byte */
```

```
/* Bit Field Zero One */
/* 0 cursor flash disabled enabled */
/* 1 flash state off on */
/* 2 cursor visible no yes */
/* 3 end of line no-wrap wrap */
/* 4 inverse video on off */
/* 5 cursor saved false true */
/* V_OFF_AD -10 L Font offset table address */
/* V_X_MAX -12 W Max X pixel value */
/* V_FNT_WR -14 W Width of Font Form in bytes (see type FONT below) */
/* V_FNT_ST -16 W First font ASCII code (first_ade) */
/* V_FNT_ND -18 W Last font ASCII code (last_ade ) */
/* V_FNT_AD -22 L Font Form address */
/* Mono Spaced, 8 pixels wide and byte aligned, any ht. */
/* V_CUR_TIM -23 B Cursor countdown timer */
/* V_CUR_CNT -24 B Cursor flash interval( in frames) */
/* V_CUR_CY -26 W Y cursor position */
/* V_CUR_CX -28 W X cursor position */
/* V_CUR_OFF -30 W Offset from screen base to first cell (bytes) */
/* V_CUR_AD -34 L Current cursor address */
/* V_COL_FG -36 W Foreground color index */
/* V_COL_BG -38 W Background color index */
/* V_CEL_WR -40 W Offset to next vertical cell (bytes) */
/* V_CEL_MY -42 W Max cells high - 1 */
/* V_CEL_MX -44 W Max cells across - 1 */
/* V_CEL_HT -46 W Cell height in pixels (font form's height) */
/* ------------------------------------------------------------------------*/

>
> At one point, I ended up with an implementation of a history list that
> snaffled 16k per command, regardless of length ....

This is not a bug, and your alternative works exactly like strdup.

The library malloc grabs memory from GEMDOS using the Malloc call.
The first call to malloc or to any function that uses dynamic memory
allocation will result in _BLKSIZ memory being requested from GEMDOS
and placed into a pool that is available only to the C library functions.
There are several reasons for this, all of them related to pecularities
in the GEMDOS memory allocation scheme.

Subsequent memory requests will not result in a GEMDOS call until the
library's private memory pool is exhausted.

#define STRDUP 1

#include <string.h>
#include <osbind.h>
```

```
extern long _BLKSIZ;
char *another;
char *original_string = "original string";
long firstmem,secondmem;

main()
{
printf("malloc block granularity: %ld\n", _BLKSIZ);
printf("Memory free: %ld\n",firstmem=Memavail());

#if STRDUP
another = strdup("This is a string");
#else
another = (char *)malloc((long)strlen(original_string)+1);
strcpy(another,original_string);
#endif
printf("Memory free %ld\n",secondmem = Memavail());
printf("Memory consumed = %ld\n", firstmem - secondmem);
}
```

Without STRDUP:

```
malloc block granularity: 65536
Memory free: 1006530
Memory free 940994
Memory consumed = 65536
```

With STRDUP:

```
malloc block granularity: 65536
Memory free: 1006480
Memory free 940944
Memory consumed = 65536
```

|> to share?

Have you set the interrupt vector ($100+13*4=$134==0x0134 in C) Do you clear the interrupt pending bit? (I don't know the address here, because I use normally symbolic addresses.) Don't use too short interrupt times (everything gets locked if you do so). To get timer A to work, you have to:

- Store the interrupt handler in the right slot (the table begins at $100 and timer A is interrupt #13).
- Install the counter in the timer data register A TDRA.
- Activate timer A and set the dividing rate in the timer control register A TCRA.
- Enable the interrupt (it's bit 5 in the first of two interrupt enable register IERA).
- Mark the interrupt in the interrupt mask register A IMRA (bit 5).

And now for something total different: The interrupt handler:

```
timerA: andi.b #$DF,IPRA ;clear bit 5 in the interrupt pending reg A
<stuff>
rte
```

This works.

If you managed to crash your system, you should have the addresses...

Bernd

> which is a direct gemdos call.

Wallmann is correct; malloc is not a GEMDOS macro.

C is a case-sensitive language. You're confusing the C library function
malloc (small 'm') with the GEMDOS function Malloc (big 'M'). They are two
very different beasts. If you interchange them (or their relatives)
casually, you're going to run into serious trouble.

Malloc(x) is a macro that expands to a direct call to a library function
that calls GEMDOS.

malloc() is a library function that has a significant amount of C code
associated with it.

You can obtain the size of the largest free block of memory available to
GEMDOS by calling Malloc(-1L). Sozobon 1.33i (Ian's Heat and Serve) has a
#define for Mavail that is the same as calling GEMDOS Malloc(-1L):

#define Memavail() gemdos(0x48, -1L)

Don't pass -1L to the C library function malloc().

it is only "standard" on atari. it is certainly not portable to anything but TOS. see below...

>>o malloc most probably is not implemented as a direct pass thru
>> to GEMDOSs' Malloc, but instead does it's own memory allocation
>> scheme, that uses Malloc. So that if your mallocing the first time,

>
>I checked this out. No go. Malloc(x) is a macro. Its expanded to

please learn the difference between "malloc" and "Malloc". the capitalized call is a GEMDOS macro. the lower case is a "portable" POSIX/ANSI C routine. they are VERY different. the origianl poster is correct. malloc is often implemented by calling Malloc.

I know I'll probably get jumped on for saying this, but why not
just use GEM and put it in a window? (a.k.a. STalker & Rufus) It would
be slower, but who doesn't use some sort of screen accelerator nowadays?

Later.......

>with.

Yes, both were on system 7. Actually, the version of the system software seems
to make no diference to the program (Speedometer 3.0) that we use anyway, it is
smart enough to shut down ALL other tasks while it is functioning. The Classic
II also rated about 15% slower on Monochrome graphics tests than the original
Mac II, even though the Mac II was using a larger screen (640*480) as opposed
to the 512*384 mac Classic screen. Basically, the Classic II is miserably slow
at everything, especially it "feels slow", I mean really, extremely slow...

Makes sense, but they also hiked the price of the LC with the 030 in it... In
addition, the LC with the 030 is about the same speed as with the 020, in fact,
it is slightly SLOWER in some areas, and slightly faster in others, but when
you get right down to the bottom line, it is within 2% or so of being exactly
the same speed.

1359. where is HD detect line on 1.44M floppy connector?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-31 21:04:00 UTC
From: fergus@areaplg2.corp.mot.com
Message-ID: <1992Mar31.210400.7922@lmpsbbs.mot.com>
Source record: 45012

Does anyone know how the high-density floppy connector on the back of the TT differs from the regular floppy connector on the back of the ST? It seems to me that a 1.44 Meg floppy needs an additional HD-detect line, but there aren't any unused wires in the standard ST connector!

PC Ditto will access only partitions c,d,e and f of SCSI 0.

To boot from C:, both C: and D: (a bug) must have the same boot block fixes as the floppies do. See endless discussions on tos1.0 - MS/DOS.

Most archieves have the little program Avante-Garde put out.

The undocumented problem many people had was the d: had to be IBM compatible also.

What I did eons ago:
1. fix up the C: and D: boot sectors to be compatible. This does not damage GEM booting after you fix the checksum.

2. install ibmbio and ibmcom on the hard disk. These want to be first in the FATS and the directory.

3. adjust the checksum as IBM wants it.

1362. Horns of a dilemma

Newsgroup: comp.sys.atari.st.tech
Date: 1992-03-31 22:05:34 UTC
From: logajan@ns.network.com
Message-ID: <1992Mar31.220534.16359@ns.network.com>
Source record: 45015

Fast Technology has come out with their TinyTurbo030. For $599 (until April 30) you get an '030 that fits in your ST or STE. It has an onboard cache, and it runs the benchmarks at or about the speed of a TT or SST. It comes with TOS 2.0 and it has a spot for a 68882 ($299.)

My dilemma is that I have an aging 520ST upgraded to 2.5M. The TinyTurbo comes in two flavors, one for the ST and one for the STE. So if I get one for the ST I won't be able to move it into an STE.

Do I want to buy an STE to replace my ST? That'll nearly double the cost of the upgrade.

Whaaaa

What is the name of the little program? This is the first time I heard about this problem. I was at one time able to install bootable DOS on a Supra 20 meg HD by using the standard format c: /s command. For some reason, however, this did not work after a reformat or two (I never figured out why). Another method is to use Norton Disk Doctor and select the option to "Make disk bootable". That always seemed to work. Make sure that any partitions that you plan to access with DOS are at least 4 meg in size.

1364. Spectre GCR and accelerator boards

Newsgroup: comp.sys.atari.st.tech
Date: 1992-04-01 03:44:06 UTC
From: ec333way@sail.uwaterloo.ca
Message-ID: <1992Apr1.034406.8363@watserv1.waterloo.edu>
Source record: 45017
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I recently saw someone mention they used an accelerator board with Spectre
GCR to get 2-3 times the performance out of it... This may be just what I need.
Which accelerators work with Spectre GCR to give a faster system?
Does the SST? Would the Tiny Turbo 030? How about one of those 25 Mhz 68000
boards?
Also, which memory boards can go up to 4 megs? How easy are they to install,
and how much do they cost? Will both an accelerator & 4 megs fit into my
1040 STFM? Does the version of TOS I have make any difference to Spectre?

Are there any commercial boards to take an old ST over 4 megs?

Here in Holland we have a fine QWK-reader (PD or Shareware), plus a nice unZIPper, which can be invoked (even automatically) from the QWK-reader. The program is called TailMail. Email me for more info.

> experiencing this problem, and it's very frustrating.

No you are not!
At least I assume that you encountered the same bug as I did.

I tracked it down to the following:

The generation of temporary filenames relies on the system
time. There is no check if that particular file does exist
allready.

So if your 'worthy Toy' is quick enough (e.g. a TT) and you are
spooling more than one file, your spoolfiles get mangled by
BATCH or BATCHMAIL. By chance this also happens on 'ordinary'
STs.

I recently reported this to the author and received an answer,
that the bug will be removed.

Please check if your problem is the same.
If not send a bug bug report to Martin Ibert.

Yes, it would be very nice if it did. Go GEM.

I haven't been following the discussion too closely...you want a non-moving
status line on the screen, and text to scroll up? Use GEM windows, if you
can. Open a window with no slider/arrows/sizer, just a title (if you want) and
an info line. Use the wind_set call to change the info line to whatever you
want. For that matter, you could have two status lines- there is that
title bar, too. If you need the full 80x24, open it to FULLXYWH. Width
checks are easy, and use the usual method of scrolling text. True, you would
again have to write a VT52 emulator, and use GEM, but it is very compatible
and extends the life of your proggy immeasurably. If you really want to hack
around with resource files, use the menu bar as a status line: there are calls
to change what the menu bar is and what is in it. Then the window needs
no controls at all. I for one don't really mind WHERE the status line is
on the screen, but I DO mind not having GEM.

Does anyone know if Atari US or Canada has released the 1.44MB floppy upgrades for the older TT's yet? Does TOS 3.06 come bundled with that? Thanks.

>questions.
>

OK, here's my .02 on this. If you use vdi, vgtxt(), and scroll your
screen using vrocpyfm(), you can lift all but the last line of text up
one line and write the new line under it. With any screen accelerator
this is quite fast, as long as you make sure your text strings start
on even boundarys.
There are a bunch of vt52 like commands listed in the vdi, like v_ron()
and v_roff(). I remember hearing a rumour that these don't work, but have
never had the need to try them. Anyone know if the esc vdi stuff works?

I'd like to see a real example of where the Line A variables do not work.
Redirection to a window doesn't qualify. TOS doesn't support it. You can
perform such redirection by intercepting BIOS output, but if you go to
that much trouble, why don't you take the extra step and support the Line
A variables? The only such program that I've seen (Gemini) does so.

The MicroEMACS text editor that I use reads the Line A variables to
determine screen size. I've run it on a couple of large-screen monitors
(Viking Moniterm and Image Systems). It worked fine.

I suppose that somewhere there may be a setup that doesn't support the
Line A variables, but that doesn't mean someone who has a standard ST
shouldn't use those variables in his or her personal software.

On my system (both Tos 1 and 1.4) the AES restructures the screen based on
the changed size. Windows Full out to one less line.

>Consider what happens if the program terminates "uncontrolled", How many lines
>will the next programs have?

Do a setexcep() or a signal call and protect the system from any program you
write. This is only common sense and common courteousy.

>Consider what what happens when you put the program in the background (under
>MiNT) and start an editor, that expects a full screen...

Reset defaults between context switches.

>
>DON'T DO IT! WE HAVE ENOUGH BAD PROGRAMS ALLREADY.
The use of the variable we've been discussing is not (at least according to
my reading of SALAD, illegal or unsupported (therefore not bad). The line a
functions will dissappear someday. Perhaps that also means the variables
will go too. But the "letter" of the announcement a year or two ago warned
only about the functions.

Hello,

a PD-katalog offered fonts and graphics in following formats:
CFN, CVG, PAC. (Just came into my mind, this must be a FAQ.
Sorry, but I haven't seen one for a long time)

I'd be glad to know what programs are they ment for (meaning
do I have to buy an expensive application in order to use them)
and what is their "internal format" (so I could use them in my
programs).

Source record: 45032

baffoni@aludra.usc.edu (Juxtaposer) writes:

-> [Coherency problems with cache and DMA]

That's right. But that happens also with the internal cache of the 030 !
Fortunately, the MMU allows you to define non-chacheable pages, and a signal
CINOUT is activated by the CPU to signal a non-cacheable transaction.
There is no such problem with the video, because the video reads the memory,
never writes it.

-> Because of this, the only reasonable place to put a cache would be in
-> the TT memory. Besides, if you are going to have to get circuitry to decode
-> bank selection, etc., for the TT memory, you might as well put the cache in
-> there and make it as transparent to the system as possible.

Don't forget the ROMs. They are the slowest memories of the whole, and they
can be cached !

But SCSI has also a DMA access to TT-RAM, as does the ZILOG SCC !

Enjoy,

Vincent.

Yes, they work. But they useless when you use an environment like the Gemini console window or MultiTOS.

ALL write accesses to Line A variables will produce garbage on the screen when
running Multi-TOS. And Multi-TOS isn't THAT far away.

Note: this remains true even if Atari doesn't say something about that.
Under Multi-TOS IT WON'T WORK. Believe me.

Extremely good points, like I said before, its doable in C, very portable,
and if anyone tells you otherwise, they are full of assembly language opcodes.

CFN usually stands for "Calamus FoNt", CVG for "Calamus Vector Graphic"
(I think you can use this in DIDOT) and PAC for PACked Pixel Graphic (used
for example in STAD, but I don't know how you can get a font out of that).

>FSM- (and FONT-??) GDOS, allocates a 8000 byte buffer

>(This info was lifted from the PureC docs)

Don't believe in everything somebody decided to put on paper.
For example - the number above was 9000 in other places.
Whomever was doing Pure C libraries used provided specs, and as
a result your library does not work - surprise.
Different "docs" which I have seen were not exactly consistent
about this particular call. In case you wonder why 16 bytes
paragraphs - this is an inedible stamp of 80x86 brain damage.
I would not worry about v_set_app_buff (bugg??). I did not find
a case yet when a presence or absence of this call on ST would
affect anything at all. If somebody has an example to contrary
I would like to know about it. I do not think that I will be
writing GEM programs for PeeCee.

here's a Apple Mac-related insight. I was over at Di-No Computers (Apple only dealership) and got to see the Quadra 900. Was I impressed? Sure! If you consider an approximately 25" or larger monitor for the thing impressive. But what had me totally (and humorously) stumped was the fact that with all this supposed power and screen resolution, when I went to scroll the window to view some files out of view, I could SEE the whole display update! We're talking really easy to see the whole thing update. Click once, and all the icons can be seen shifting one icon down to show the icon above it. Hmmph! Giggle. Is this 900 monster that slow or is it the fact that System 7 is actually that processor hungry? What gives, guys?

>invoked in "maintenance" mode).

I have a short and kludgy program which "massages" the boot sector on a
ST disk so that msdos can read it. All you need to modify is the first
three bytes. If there's any interest, I'll post it: it really IS short
- I entered it using DEBUG (blush!) - but not accessible to me at this
instant, or else I'd post it right now.

Disclaimer: if you've put a non-standard format (>9 sectors/track) on
your Atari disks, you may still have trouble reading them, and my
program may wipe out your boot sector.

I've not used it for a while, since I use a variant of FDFORMAT on an
MSDOS machine to format all my disks. I sent a copy to the author, but
haven't seen (or looked for) any new versions of his software. Mine
puts the Atari's 24-bit random number in the right place: some ST
software actually uses this!

Yet. However, MiNT certainly does, and MultiTOS is based on MiNT, so it
shouldn't be a big surprise if MultiTOS supports it.

Examples of where the Line A variables don't work: anything running in
a window under MiNT (e.g. with MW2, BGACC, or MGR). Even if the emulator
did support Line A variables, there's only one set of line A variables
in the system, so if a VT52 program changes them then *all* windows
would be affected. Trying to avoid this problem would only create more
headaches than actually writing a VT52 emulator would (I know, I've
written a couple: for BGACC, and for MiNT's fasttext output device).

I would recommend that the line A variables, like the BIOS keyboard
tables, should really be considered "read only" except to programs
that are specifically designed to configure the system (like CPXs or
ACCs).

KEvin, if you format your 3.5" disks in the PS/2 in 720k format you can
use them straight away in your 1040ST without any problem.

DC's (Double Click) have a PD software utility to do this with pre
TOS 1.4 machines called DCFORMAT. This will allow you to format in true
IBM format on the ST. If you have TOS 1.4 or greater and you format
with the desktop option it is 100% IBM format.

Hope this helps..

Liz,
The simple answer is Yes you can do just that. Most 1.2 meg 5.25" disk
drives will work 100% as drive A or B and have 720k of disk storage

Is there a way to create a buffer for the parallel port just like the
buffer for console input? I'm writing a small program to transfer
data between computers over the parallel port so any info and help
is welcomed.

Ok.. I have a quick question for those of you who program (Gasp!) GFA Basic...
I need to draw some screens in memory while my title screen is displaying,
but I don't remember much about how this is done. Any help would be great..

Oh.. to use an evil line-a command to make a status line, Dpoke L~N-32,23
would do it, but since line-a is evil or something, I'm not responsible for
turning your ST into a cabbage or something.. :)

I do. I think ARC is STill the FidoNet standard when sending mail to an unknown system in FidoNet, not that this has anything to do with QWK packets.
I'd like to hear when you have this available, would help many users here...

1401. Need help with MSA format

Newsgroup: comp.sys.atari.st.tech
Date: 1992-04-04 16:52:31 UTC
From: smackinla@cc.curtin.edu.au
Message-ID: <1992Apr5.015231.1@cc.curtin.edu.au>
Source record: 44901

I recently posted a request for help with the MSA program on c.s.a.s but didn't get any helpful replies. What I'm looking for is the source to an unMSAing program or at least the format of the file the program creates. The reason I need it is that I only have a single drive in my ST, and swapping disks every track or so does _not_ turn me on!

If I can get hold of the source or the file format, I will make an effort to distribute a modified psuedo-intelligent (ie: not too many disk swaps) version.

Thanks for any help.

Pat -- have a day!

I know nothing about GFA, but since I suppose it's possible to make XBIOS-calls
in GFA...:
XBIOS 5 (Setscreen) allows you to set the addresses of the logical and physical
screen. The physical screen is the one you're viewing (your title screen) and
the logical screen is the one you're drawing.
By allocating enough memory for the various screens and by swapping the logical
screen addresses, while holding the phys.scr. unchanged, it is possible to draw
various screens 'in the background' while displaying your welcome screen. (if
this takes long, use Dosound (XBIOS 32) to play some nice piece of music while
the user is waiting (e.g. parts of Bach's Goldberg Variations :-))
O, BTW: related functions: Physbase (XBIOS 2): gets the address of the current
physical screen; Logbase (XBIOS 3): same for the current logical screen.

1404. Ack! GCC stdio losing characters? (MiNT?)

Newsgroup: comp.sys.atari.st.tech
Date: 1992-04-04 20:45:36 UTC
From: atilghma@sdcc13.ucsd.edu
Message-ID: <31341@sdcc12.ucsd.edu>
Source record: 44904

```
Help! I'm trying to read in a DEGAS .PI3 from standard input
with the MiNT libraries (v.1.9) and MiNT 0.93 - but somehow 4 bytes
are being lost in the pipe! When I issue an "a.out < degas_f.pi3"
command to MNTSHELL, I only get 32030 characters before EOF, while
the file on-disk is 32034 bytes in length...
However, when I force-feed my program 32034 "A" characters, it
works fine -- leading me to believe that some "special" characters
are being waylaid... Should I be using something other than:
for (tc = 0; (c = fgetc(stdin) != EOF); tc++);
to grab the incoming characters?

Many thanks!

I have a Supra 30meg harddrive that I bought in 1988 or so, and the
symptoms are very identical, i.e. it suddenly would seem to slow down
and try to restart or something. Since I have second external harddrive,
I haven't bothered looking into it, but one thing I noticed was that
over the years some grinding whining noise was becoming permanent.
So in addition of checking the powersupply, it might also be the
drive axel which has more resistance than it should, and cannot keep
up the speed anymore. Please let me know if you find a fix.
In a START magazine they recommended putting a drop of oil on the
harddrive bearing, however I always assumed that you harddrives
are totally encased. Well, I'll look into it.
There are also companies that advertise trading in drives, are
rebuilding them, if it is the drive and not the power supply.

i think there are problems reading binary data from stdin. your file
was probably all read, but any 0x0d,0x0a "string" might have been
translated to just 0x0a. i'll bet that you have 4 of these in the file.

my workaround has been (with non-MiNT libs at PL71 - sorry, jrb, have
not had time to upgrade since i'm on the road all the time these days)
to not use stdin and open a file "rb". i could not get stdin reset to
binary mode with UNIXMODE=b (which seems like a bug in startup code).
see if this helps...

I put a set of instructional files and drivers for such drives on
atari.archive.umich.edu, in a file called ibmdrive.lzh. The ability you
desire is relatively easy to accomodate, given that you are willing to
bolt some stuff together and make a simple cable. I had such a device set
up in the past, and it worked fine.

From: adhir@cygnus.umd.edu
Message-ID: <12353@umd5.umd.edu>
Source record: 44909

I have a practically brand new 1040STe with 4 megs (same one I'm trying to sell). Since I've had it, for some reason, I can't boot from my HD in color. It boots perfectly in mono, and in color from the disk drive (as in games that autostart or holding control-shift-alternate), but the only way I can boot from HD in color is by being in mono, beginning the boot process, and immediately after the computer says 'hey' to the hard drive (the little green flash and grinding from the HD), pressing the monitor master switch forcing a reboot into color. It then boots fine the way it's supposed to.

I am using Superboot v7.2 and ICD Software v5.1.0. The host adapter is an ICD ADSCI+ without the clock. Any help would be appreciated.

Also, is there any anonymous FTP site from which I can get the latest ICD HD utilities? Thanks...

From: fnjlh1@acad3.alaska.edu
Message-ID: <5APR92003919@acad3.alaska.edu>
Source record: 44910

I tried to plug a known working Panasonic 1.44M floppy drive mechanism into a SF314 body, but couldn't seem to recognize it from the desktop. The 34 cond ribbon cable in the little adapto board of the 314 seemed to be backwards from the "striped wire is #1" convention, with the stripe going to the pin labelled 34 on the little board. I tried it both ways onto the Panasonic's plug but couldn't recognize it from the desktop either way (and prohibiting the boot from floppy A sequence in one configuration).

I'd like to be able to substitute a generic 3.5 floppy for the Epson that came in the SF314.... any suggestions as to why what I did didn't work? Any help appreciated.... thanks! j harris/fairbanks

No! A printer spooler is something quite a bit different.

What I need is a driver of some kind that lets me use the parallel
port almost like the serial port. This would probably include some
kind of circular buffer with some additional OS-calls to control
the buffer.

Does anyone know anything about this?

Only GEnie and ICD's support BBS, they are the only places that you
can dnload ICD booter, also version 5.1 is buggy..

Have you tried it with out SuperBoot..?? and killing all those TSR's
and ACC...??

Source record: 44915

```
Since you didn't specify whether you meant the modem ports or
the high speed DMA serial port, I'll give you all three:

Modem 1
-------

Pin 1 Carrier Detect
Pin 2 Received Data
Pin 3 Transmitted Data
Pin 4 Data Terminal Ready
Pin 5 Ground
Pin 6 Not Connected
Pin 7 Request to Send
Pin 8 Clear to Send
Pin 9 Ring Indicator

Modem 2
-------

Pin 1 Not Connected
Pin 2 Received Data
Pin 3 Transmitted Data
Pin 4 Data Terminal Ready
Pin 5 Ground
Pin 6 Not Connected
Pin 7 Request to Send
Pin 8 Clear to Send
Pin 9 Not Connected

OOPS! I made an error -- Pin 8 on Modem 2 should read NOT CONNECTED. Sorry.

Serial 2
--------

Pin 1 Carrier Detect
Pin 2 Received Data
Pin 3 Transmitted Data
Pin 4 Data Terminal Ready
Pin 5 Ground
Pin 6 Data Set Ready
Pin 7 Request to Send
Pin 8 Clear to Send
Pin 9 Synchronous Clock

And, for the heck of it, the LAN port:
```

Pin 1 Handshake Output
Pin 2 Handshake Input or Internal Clock
Pin 3 Transmit Data
Pin 4 Ground
Pin 5 Received Data
Pin 6 Transmitted Data
Pin 7 General Purpose Input
Pin 8 Receive Data

(Remember -- it's an 8-pin DIN female RS-422)

Hope this helps!

Rob

Message-ID: <1992Apr5.173635.21348@usenet.ins.cwru.edu>
Source record: 44916

From what I recall from reading on GEnie, there may be some
jumpers on the back of that drive that need to be changed in order
for it to be recognized.

Hope this helps!

Rob

1417. Re: 3.5" floppy drives

Newsgroup: comp.sys.atari.st.tech
Date: 1992-04-05 18:04:32 UTC
From: bossoj@aix.rpi.edu
Message-ID: <xvztg1-@rpi.edu>
Source record: 44917

Make sure the jumper for the drive number is set correctly. If this drive is number 1 , set it to 00; if it is drive 2, set it 01. I have an Epson 1.44 meg external in it's own case as drive two, the jumpers are set for 01, I didn't have to remove any terminating resistors, and it will also work as drive 1 (unmodified) if I remove drive 1 from the chain (I have an SF354 as drive 1) and plug it sdirectly into my 520ST.

Hope this will help!

>(only really noticable in the dark) even when the drive's not being used?

This happens on ST's as well. TOS checks once every VBlank to see whether
the write-protect status has changed on the floppy drives. It uses this
information to figure out whether a floppy media change has occured. This
method only works with write-enabled floppies and drives which have no
media-change circuitry (or which have such circuitry disabled).

1420. SST

Newsgroup: comp.sys.atari.st.tech
Date: 1992-04-06 04:32:00 UTC
From: ec333way@sail.uwaterloo.ca
Message-ID: <1992Apr6.043200.6163@watserv1.waterloo.edu>
Source record: 44920
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Just a couple of questions I need confirmed about the SST
(I talked to Dave Small at ACE, but the 'flyer' about the SST doesn't make it
clear and seems to imply the opposite)..
Is the non-mega SST available? I have a 1040STFM..
ALSO, do I _NEED_ to have 4 megs in my ST before being able to add memory to
the SST? The flyer kept talking about adding memory to the existing 4M...
Finally, Is the Megatalk board REALLY important?
Can I add a CD-rom without one?
Will a megatalk board run in the good old MEGA ST's (as opposed to STe's)??
I may have to pick up a used mega st soon if this is the case..

Thank you,

Yeah, some of the ICD software allows me to reorganize the partition mapping. I hadn't thought what this would do to PC DITTO, but it shouldn't matter, since the partitions are consecutive, anyway.

>2. PC-Ditto. Originally the TOS ahdi drivers only produced 4 partitions.

No flames -- I should have mentioned that I am using an ICD controller with a Syquest drive. All the partitions are GEM, and the fact that I can list the directory tells me that the I'm getting the right partition, just that something is goofy about the disk itself. Maybe something about the FAT table or something?

Has anyone else seen this?

1425. 2 HD's on MSTe Host Adapter

Newsgroup: comp.sys.atari.st.tech
Date: 1992-04-06 14:31:22 UTC
From: "Anthony Paul"
Message-ID: <8394@bnr-rsc.UUCP>
Source record: 44925

I was talking to Bill Rhebok (sp?) at the ACE show in Toronto this weekend. He told me that it was possible to connect (and use) 2 drives to the MSTe host adapter. He said the version of the software was a factor. I got version 5.0 of the atari Hard disk driver.

OK, you know the 3 dip switches on the adapter board? well he said they were actually backwards and off and on are reversed. What he said to do was to flip the switch numbered 3 (or was it one?) to the other position. This switch is the MULTIPLE DRIVE ENABLE. The other 2 switches are only for SCSI offset (if you set them, you would put your 2 drives as 2 and 3 or 3 and 4 or 1 and 2 instead of the normal SCSI IDs of 0 and 1. So these should be irrelevant to us. Unfortunately, I don't have my other SCSI drive and 3 ended cable with me (and won't till late may) so I can't try this. Previously I tried 2 drives and all combinations of the 3 dip switches - no luck, BUT I was running veriosn 3.x of the software.

So I'd like someone to try flipping one of the end dip switches (if one doesn't work, try the other) and trying to hook 2 drives with the rev 5.x software.

Hopefully, this will bring some greatly needed storage space to us MSTe adapter people.

Any questions, please ask.

The show was great, seemed like a big success to me.

Anthony Paul

1426. help with sozobon getenv()

Newsgroup: comp.sys.atari.st.tech
Date: 1992-04-06 14:45:22 UTC
From: randyh@hpsad.HP.COM
Message-ID: <18420015@hpsad.HP.COM>
Source record: 44926

I'm trying to compile a program with the ~heat&serve~ sozobon using dlibs.
In particular the calls to getenv() are not working.

```
main()
{
char *ep;

ep = getenv("some_env_var");
printf("%s\n", ep);
}
```

When I compile this I get an error:
Integral type not allowed - line 5 (or something like that)

I then change line 5 to:

```
ep = (char *) getenv("some_env_var");
```

as it appears that no header file defines the return type of getenv().

This will now compile but when I run the executable I get a buss error
from MiNT.

Can anyone give me some help with this?

Thanks, Randy Hosler

1427. Where can one get a new mouse quickly?

Newsgroup: comp.sys.atari.st.tech

Greetings.

We've got an ST with a mouse that appears to be on it's last legs. (In particular, it seems to be growing less and less sensative to clicks and double-clicks.) We needs a new mouse before a concert to be given April 24. I called the only local dealer listed in the phone book, and was told that they only had rebuilt mice (for $42.00) and that ordering a new one would take a month. Not good enough. What's the *FASTEST* way to get a reasonably priced ($60 sounds reasonable to me), decent mouse to Washington, DC? Any good sources?

Thanx.

1428. binary i/o on stdin with GCC

Newsgroup: comp.sys.atari.st.tech
Date: 1992-04-06 16:33:32 UTC
From: rosenkra@convex.com
Message-ID: <1992Apr06.163332.13631@convex.com>
Source record: 44928

i wrote a test program to check reading binary stdin. as bammi pointed out to me, this should work with UNIXMODE set to 'b'. i confirmed this with non-MiNT GCC 1.40 with libs at PL 71. i did not try it with the latest MiNT libs, tho i see no reason for them not to work in a similar fashion.

here was the code:

```
#include <stdio.h>
main(int argc, char *argv[]) {
int c;
while (1) {
c = fgetc(stdin);
if (feof(stdin)) {
printf("end of file\n"); break;
}
printf("c = 0x%02x\n", c);
}
}
```

here was the dataset:

```
a<cr><lf>test<cr><lf><cr><lf>
```

executed under Gulam (no MiNT) with UNIXMODE unset:

```
% unsetenv UNIXMODE
% tst <tst.dat
c = 0x61
c = 0x0a <------ cr/lf mapped to lf only
c = 0x74
c = 0x65
c = 0x73
c = 0x74
c = 0x0a
c = 0x0a
end of file
```

executed with UNIXMODE:

```
% setenv UNIXMODE b
% tst <tst.dat
c = 0x61
c = 0x0d <------ cr/lf mapped to cr/lf
c = 0x0a <------
c = 0x74
c = 0x65
```

```
c = 0x73
c = 0x74
c = 0x0d
c = 0x0a
c = 0x0d
c = 0x0a
end of file
```

as you can see, the CR-LF is correctly interpreted in both cases, depending on UNIXMODE. i presume the original poster having problems with reading the degas file from stdin how has some recourse. i don't know if UNIXMODE can be set from the desktop. probably, with some sort of auto folder prog.

so it looks like there are several options to read binary data:

- set UNIXMODE (all streams)

- muck with _flags in FILE structure

- binmode() call (tho not for stdin)

- open a file with "rb"

sorry for the misinformation. i was having some problems with a code some time ago and incorrectly blamed the GNU C startup code. it was more than likely my own bug (that i now have to fix). i should know better...

This is an evolution which I personally deplore. BBS systems should cater
for general connects like all other online services, rather than assuming
all the world owns an IBM PC. Most of your problems stem from the fact
that the STs extended character set is not the same as PCs, thus the PC's
linedrawing characters are not available. This is really a font problem
fortunately STs use exclusively soft fonts, so it aught to be easy to
load an IBM compatible font into your ST in order to get the semi-graphics
printing right (instead of junk coming out). Problem is that no-one seems
to have done much about drawing an IBM compatible font (8 and 16 bit) yet.

Any takers ...

This was a hack for backward compatibility. The next version of Gemini
won't do this.

>The MicroEMACS text editor that I use reads the Line A variables to
>determine screen size. I've run it on a couple of large-screen monitors
>(Viking Moniterm and Image Systems). It worked fine.

You can do MUCH better:

(1) If you want to support MiNT, try the new ioctl's for the terminal
size.
(2) Use termcap or terminfo.

A _very_ easy way:

(3) Use the environment variables ROWS and LINES (if LINES is not set, use
COLUMNS). This way it already works with the Gemini console window,
and this is what POSIX propagates.

If all this fails, use the negative Line A vars. This way, every user can
override the possibly wrong Line A values.

>I suppose that somewhere there may be a setup that doesn't support the
>Line A variables, but that doesn't mean someone who has a standard ST
>shouldn't use those variables in his or her personal software.

Yes, but every software that is released to the public, should be as
well behaved as possible. Especially in this case you see, that it's NOT
much work.

1431. PC-Ditto 1 and TOS 1.04

I tried to E-Mail you but your path is incorrect..

Try a Golden Image mouse, they cost here some $50/60 nz, should cost
over there some $25us, they use micro-switches..

The later ones have a switch for Atari/Amiga, so try a Amiga shop..

I use a early Amiga one with 2 wires changed around.

I would think you should have a declaration
char *getenv();
somewhere. Remember that any undeclared functions in C are assumed to
be ints. Hence the complaint Integral type not allowed. With the cast you are
really stirring things up. Assuming that int and pointer are returned from
functions in the same register, the compiler will only take the int value of
the returned value (unless you happen to be using 32-bit ints :-). Casting
this to (char *) will then sign-extend it to a 32-bit pointer, in essence
losing the higher bits of the address that was originally returned. If the
return mechanisms are not the same, all bets are off -- you'll just get
garbage.

if you have a double-sided drive on the Atari, just format the disks on
a PC as normal 720k disks. The Atari will have *no* trouble with them.
If you have a single sided drive, the person with the PC needs to add
the following to their CONFIG.SYS (assuming the 3.5" drive is drive b:)

device=driver.sys /d:1 /f:1 /h:1

This creates a "new" drive letter for the B: drive and tells the
system that it is a single sided 3.5 drive.

This all works because the Atari uses MS-DOS directory structures!
The only catch is that DOS requires the first sector after the index
hole to be sector 1. The Atari ignores the index hole. That's why
you need to format the disks on a PC...

I "converted" files to PC format for a friend with an Atari for
years. His editor never complained about the disks with the manuscripts
on them...

> printf("%s\n", ep);
> }
>
> When I compile this I get an error:
> Integral type not allowed - line 5 (or something like that)

Right. You have not declared the function getenv(), so the compiler
reasonably assumes that it returns an int. Pointers and ints cannot
be casually interchanged, so the compiler complains.

> I then change line 5 to:
>
> ep = (char *) getenv("some_env_var");

All this does is tell the compiler to shut up and accept the conversion.
It doesn't fix the problem.

> as it appears that no header file defines the return type of getenv().
>
> This will now compile but when I run the executable I get a buss error
> from MiNT.

You get the bus error because the 32-bit value returned by the getenv
library function is truncated to 16 bits, then extended to 32. The
result is a garbage pointer.

The right way to fix this is simply to declare the function in your
code:

main()
{
char *ep;
char *getenv(); /* getenv returns a pointer */

ep = getenv("some_env_var");
printf("%s\n", ep);
```

```
}

>I've noticed that different software read the above label differently.

>Any comments?

MS-DOS treats the volume label as a string with a max len of 11 chars in
which all characters (even wildcards) are allowed. Lowercase letters are
mapped to uppercase.

Atari TOS returns (at least in my 1.04 here) the vol label with a dot
after the eighth position if longer names were created. Also, the desktop
inserts this dot in its mask for form_do() at the disk info. If you
create a label containing a dot, the string before the dot is padded to
8 chars as in normal file names.

Seems the programmers didn't have any idea of what they programmed... :-)

> exception of one with a single sided drive).

You have, of course, the (relatively) tedious option of using the 'pseudo-B'
drive on a 1-drive system. Run the SHADOW program (the unMSA program, not the
background downloader... :)), locate the .MSA file on the =B= drive, and let
the unMSA program write to the =A= drive.

BTW, I don't know of any of the MSA-ed demos on the atari.archive server which
do not require a double-sided disk drive...

1442. Sozobon 1.33i Heat'n'Serve bugs

Newsgroup: comp.sys.atari.st.tech
Date: 1992-04-07 12:26:56 UTC
From: tony@microware.co.uk
Message-ID: <917@mwuk.UUCP>
Source record: 44692

Hi Folks,

I have been very successfully using the Heat'n'Serve Sozobon C 1.33i
that was posted a while ago. I think it may even be better than the
Lattice C 3.0.4 that I paid real money for some years ago. It's
certainly nicer to use!

I have found a couple of bugs in the header files:

1) In stdio.h, the definitions of stdprn and stdaux are reversed. I
wondered why my program wouldn't print, and then discovered the
characters falling out of the serial port. :-)

2) In types.h, the types BYTE, WORD and LONG are defined as
unsigned. I have seen published code which relies on them being
signed (book: Atari ST Application Programming), and they are
signed in Lattice 3.0.4. I changed them to the following:

```
typedef char BYTE;
typedef int WORD;
typedef long LONG;
typedef unsigned char UBYTE;
typedef unsigned int UWORD;
typedef unsigned long ULONG;
```

3) Sometimes, when running top, the optimizer, I get a number of
messages saying something like:

```
top: bugchk - filler bytes not equal (doesn't affect codegen)
```

Can I safely ignore it - what does it mean? The program in
question seemed to run OK. Unfortunately, I have now modified
the program and the message no longer appears. (Well,
unfortunately for bug-hunting, anyway :-).

Any comments?

Tony.

Are you sure that the machine is really running slower?
Maybe the program does not work correctly when run on a TT.
After all, the TT did not exist when the program was written
and it does rely on PEEKing in special places in the
operating system.

On a related note I tried to pack all files (including directories)
within a volume with the usual command (from GULAM shell)

zoo ah// new_arc *

recently, but found that it failed because I had named one of the directories
RDE_ALL.TOS i.e. ZOO_v2.1 appears to assume that anything ending in .TOS is
a program. Surely it OUGHT to check this - which is a simple enough task.

On extraction, a similar difficulty with folders ending with .TOS
(and, presumably, with folders ending in .PRG and .TTP also - but I have
not checked this) occurs.

Unfortunately this is not practical on a machine with 512k! Don't laugh! I will probably upgrade my machine to a bit more memory at some stage, but that's not the point. I _should_ be able to unMSA a disk on _any_ ST (with the possible exception of one with a single sided drive).

Pat -- have a day!

I'm sorry, but this is totally wrong. The only reason that one had to format
the disks on the PC was that the older TOS versions didn't write the boot
sector in a 'compatible enough' way.

The ONLY thing required to make ANY ST DS DD 720 K disk PC-compatible is to
get a sector editor, and change the jump instruction in the first three bytes
(from "60 xx" to "EB xx xx", I use "EB 34 90"), and fix the media byte (the
first byte in the first sector of each FAT, usually found on sectors #1 and
#6, counting from 0) by changing it from F7 to F9 (all numbers in hex).

Of course, if you format your disks on the ST with one of the modern formatting
tools, the program does it all for you.

I recommend MDISK, which is a clever combination of RAM disk/copier/formatter
accessory. It's free, and can be ftp'ed from varios atari servers. It's also
included with the CS-TeX package.

There is a GOOD reason not to use a GEM Window. The first reason, which
you mentioned, is that the speed is VERY slow. Even with accellerators,
the output can't keep up with more than 2400 baud in Stalker. Without an
accellerator it would be hideously slow. Also, a GEM window takes up
space. Instead of 25 lines (24 with a status bar) you would have 23
lines and be forced to put the status bar at the top of the screen.
There is also the added joy of having to handle more complex redraws.

No, a window is not the way to go for me. The mailer and newsgroup
machine was not working regularly, so I think I missed a lot of this
thread. I did find out one way to shorten the screen. Subtract 1 from
the value contained at $2AB2 and you have a shorter screen. Add 1 when
you want to update the status bar. It was as simple as that. At least
for monochrome. I'll have to try it with color as well, since I am not
sure if the address applies to all ST machines.

Thanks for the help.

I was under the assumption that the cast would work the same as
a declaration. Sounds easy enough to fix. :)

Still, I don't understand why dlibs doesn't have a header to declare
getenv(). Maybe I'm missing something. I grepped my include directory
and found no reference to getenv().

Randy Hosler

Michal, thanks for the email reply.

>main()
>{
> char *ep;
>
> ep = getenv("some_env_var");
> printf("%s\n", ep);
>}

try this instead:

#include <stdio.h> /* for NULL define, usually */
char *getenv(); /* or #include <stdlib.h> if you have it */

main()
{
char *ep;

if ((ep = getenv("some_env_var")) != (char *) NULL)
printf("%s\n", ep);
else
printf("some_env_var not found\n");
}

you could also do:

ep = getenv("some_env_var");
printf("%s\n", ep != (char *)NULL ? ep : "not found");

you should test the return since getenv returns NULL pointer of
it fails. this probably causes the bus error.

I'm afraid that you must have missed the original posting. The whole idea was
to get away from doing the hundred odd disk swaps required to unMSA the file
using the psuedo disk drive.

Pat -- have a day!

PS: Why do people write programs like this in the first place!?! You would think
they would have learnt from all the versions of TOS < 1.4 how tedious it was
with a single drive!

>you need to format the disks on a PC...

Not true.

Follows is a program I wrote way back in 85, to convert Atari DS disks
to a format the PC can read. The problem is that MSDOS expects a jmp or
jmp short in the first byte of the boot sector. This program also fixes
up the bpb.

```
code segment byte public
assume cs:code,ds:code

org 100h
atari proc far
start: jmp short over_data
sigon db 'Atari ST -> IBM disk patcher',13,10
db 'Copyright (c) 1985, Timothy Purves',13,10,'$'
err_msg db 'DISK ERROR!',7,'$'
mode_flag db 0

over_data: push ds
pop es

mov dx,offset sigon
mov ah,9
int 21h

mov mode_flag,2
call diskio
jc error_out
mov word ptr [bx],34EBh ; short jmp
mov byte ptr [bx+2],90h ; nop
mov byte ptr [bx+15h],0F9h ; media type
mov byte ptr [bx+200h],0F9h ; Fat ID
mov word ptr [bx+201h],0FFFFh ; Fat Marker
mov mode_flag,3
call diskio
```

```
mov al,0
jnc normal_out
error_out:
mov dx,offset err_msg
mov ah,9
int 21h
mov al,1
normal_out:
mov ah,4ch
int 21h

atari endp

-tpurves

diskio proc near
mov cx,5
retry: push cx
mov ah,mode_flag
mov al,2
mov dx,0
mov cx,1
mov bx,offset disk_buffer
int 13h
pop cx
jc reset_disk
or ah,ah
jnz reset_disk
ret
reset_disk: xor ax,ax
int 13h
loop retry
stc
ret
diskio endp

disk_buffer equ $
code ends

end start
```

1455. 3.5"floppy, now flaky ST

After trying to plug in a HD floppy into my SF314, I seem to be getting odd memory problem(NeoDesk sez I've 37548 left after running any prg in a 2 2.5M system), possible floppy screwups and general confusion. Did I singe my ROM somehow???? Can I get the lower TOS numbers anymore? Will Linda succomb to Todd's impassioned (sorry, wrong group) I had TOS 1.0 (6 chips).

My wife is giving me heat on this("You did what to a working computer??") Any help appreciated! Thanks j harris /fairbanks

That would install a new driver. In my CONFIG.SYS file I have the following:-

drivparm = /d:1 /s:10

which modifies the parameters for drive B: to accept 10 SPT disks. Curiously
it also lets drive A: read them too if you only have one floppy.

1457. Media Change Questions

Newsgroup: comp.sys.atari.st.tech
Date: 1992-04-08 10:42:22 UTC
From: ralph@laas.fr
Message-ID: <RALPH.92Apr8124222@orion.laas.fr>
Source record: 44707

I am curious as how to properly handle Media Changes in my software,
both wanted and unwanted occurences. I am doing this on a Mega 4
running under TOS 1.2.

As I understand it, when MediaCh() goes from 0 to 1 or 2, on the next
read or write [I use Rwabs()] I will get E_CHNG or -14 as the return
code from Rwabs():

Rwabs(0,...), ChangeDisk, Rwabs(0,...) gives -14.

Furthermore, other calls to the program after this keep giving -14 as
a return code for Rwabs().

Rwabs(0,...), ChangeDisk, Rwabs(2,...) executes properly.

But the state of the ST is left at -14 if I call the program again.
Even the following works properly:

Rwabs(0,...), ChangeDisk, Rwabs(2,...), Rwabs(0,...) executes properly.

But the state is left at -14 as concerns GEMDOS, etc.

A friend passed me his Lattice C documentation, and it stated that
Get_BPB() resets the MediaCh() flag to 0. Now the following works:

Rwabs(0,...), ChangeDisk, Get_BPB(), Rwabs(0,...) executes properly.

Unfortunately, they state that a Media Change should be forced before
calling Get_BPB() since the latter may cause system buffers to be
lost.

In this case, how does one *force* a Media Change such that GEMDOS and
BIOS recognize it?

Maybe it is the same question, but how does one force GEMDOS, etc. to
flush its internal buffers for a device? Does a *Forced* Media Change
take care of this.

Thanks to all, in advance.

1458. Rwabs() vs. lRwabs()

Newsgroup: comp.sys.atari.st.tech
Date: 1992-04-08 10:52:31 UTC
From: ralph@laas.fr
Message-ID: <RALPH.92Apr8125231@orion.laas.fr>
Source record: 44708

As I understand it lRwabs() exists only since AHDI 3.01. Does that mean I can use it on my Mega 4 ST running TOS 1.2 if I install AHDI 3.0x or even AHDI 5.0?

What are the relationsships between Rwabs(), lRwabs(), and _hdv_rw ($476)? Are the _hdv* variables installed by AHDI? When I was single-stepping (w/ szadb) a call to Rwabs(0,...) on my floppy (A:), I was amazed to see the program go through _hdv_rw.

Any enlightenment on the subject would be appreciated. And, yes it is probably detailled in "Das Scheibenkleister" but that hasn't been translated yet.

Thanks,

Do you have ste_fix.prg in your auto folder? I never knew what this little fixer did until I tried to boot without it and couldn't boot into medium rez. Some problem with not reading the desktop.inf file or something.

I have no monochrome so I guess the hardware keeps it from trying to boot monochrome. I'd say this is your problem.

Funny, I don't see this on the atari archive list. Is this something that comes with the ICD stuff maybe? I bought my system used and all this stuff was already loaded, so it's a mystery where it all came from.

I have it, will share it upon request. There is nothing to indicate a copyright.

>for monochrome.
Who guarantees that this will work with alternative screen-drivers, with
other resolutions than the standart (e.g. autoswitch-overscan, new graphic-
cards, etc....)? Will it run under MGR or with MW? On a TT? Is $2AB2
a documented system-variable? Your program will only run on some special
machines with a special TOS. Don't do that!!!!!!!
> I have to try it with color as well, since I am not
>sure if the address applies to all ST machines.
Please try also on all graphic-cards, on all STs on a TT, the new falcon, under
all TOS-versions, under MiNT, MTOS and please test also all screen accelerators
...:-(
Thanks.

> Still, I don't understand why dlibs doesn't have a header to declare
> getenv(). Maybe I'm missing something. I grepped my include directory
> and found no reference to getenv().

No, you're not missing anything, it's jut not there. I think the reason is simply that dLibs predates ANSI. Dale Schumacher created the library as a replacement for the Alcyon C library long before Sozobon existed. Over the years it has gained some ANSI-like properties, but it isn't there yet. For his Heat and Serve 1.33i package, Ian Lepore added a pseudo-stdlib.h file but didn't include a declaration for getenv.

If you switch to the MiNT library you'll have a far more ANSI-like setup, even though you still can't handle prototypes.

> Stalker. Without an accellerator it would be hideously slow.

I beg to differ. Based on my own experience, an unadorned 8MHz TOS 1.0 can keep up with 2400 baud in STalker. Adding a software screen accelerator and/or a CPU enhancement can increase this to the point where 9600 baud screen output is achievable. I should add however that the main limitation under VDI is not the text output speed but the scrolling speed. You'll fall a bit behind if you get a blast of LF's in a row, but under more typical situations STalker can keep up. On a T16-equipped Mega4, according to a small test program I wrote, the best I could do was around 50 scrolls/second for an average-sized window.

The one very good reason TO use a GEM window is compatibility. Sticking to a VDI-only implementation may cost you a little in terms of speed, but in my humble opinion, you gain much more than that back in terms of compatibility and ease of use.

> Also, a GEM window takes up space. Instead of 25 lines (24 with a
> status bar) you would have 23 lines and be forced to put the status
> bar at the top of the screen.

In TT medium-res, Overscan, or any of the 3rd party high-res video cards there is plenty of room for everything.

> There is also the added joy of having to handle more complex
> redraws.

True, but as they say "no pain, no gain".

> No, a window is not the way to go for me.

Evidently not. If your main concern is to get something that does the job on specific systems, then do whatever you like. I think the original question though was how to reserve a screen line in a "safe" manner, and as the ongoing discussion has shown, there are varying degrees of "safety", the ultimate being a GEM/VDI-based implementation.

> Subtract 1 from the value contained at $2AB2 and you have a shorter

> simple as that. At least for monochrome. I'll have to try it with
> color as well, since I am not sure if the address applies to all ST
> machines.

Hmmmm, you're already in dangerous territory - the address you mention
is almost certainly not the same across TOS revisions, and could
conceivably change within a TOS version due to a screen accelerator.

Good luck,
Eric Rosenquist

1463. Are Ataris really this bad with HD's?

Newsgroup: comp.sys.atari.st.tech

I have a SyQuest hard disk with an ICD controller. I have a 14 meg Atari partition and a 30 meg partition for Spectre GCR (Mac emulator)... Whenever a file is written to disk in Atari mode the system locks up for about 5 seconds and then suddenly spits the file onto the disk. Presumably it is reading the directory and FAT during this delay. I know the drive is reasonably fast - in Mac mode it will write files instantly. It seems that the Atari operating system is very slow when dealing with anything bigger than a floppy disk (which doesn't surprise me). Does anyone else have this problem? I have TOS 1.3... Do the new versions of TOS have the same problem?

Source record: 44713

A friend of mine has asked me to do some data acquisition work
on his Atari ST. Unfortunately, I know IBM's and I know Amiga's
but I don't know ST's. I would like to read 512k-1024k of data
from either EPROMs or SRAM cartridges and be able to store it to disk.
After looking at the connector pinouts of various ports on the
back of the ST, I was thinking that the cartridge port would
be well suited to the task.

How is the cartridge port addressed? How do the ROM select lines work?
Does the system automatically pass control the cartridge on power
up? Does anyone else have any better ideas on how to read
information off of an EPROM or SRAM cartridge?

E-mail responses preferred.

1465. DMA with SCSI on TT030??

Newsgroup: comp.sys.atari.st.tech
Date: 1992-04-08 20:55:22 UTC
From: vspicer@ccu.umanitoba.ca
Message-ID: <1992Apr8.205522.13721@ccu.umanitoba.ca>
Source record: 44714

hello. we are having some problems with SCSI DMA transfers on our TT030.
we have previously developed code to talk to an exabyte 8200 tape drive
via the SCSI port, but the code handshakes the bytes across using
software control.

the TT tech manual explains the process of setting up the SCSI DMA, including
the odd-byte addressing in the pointer and counter addresses. this is
not a problem. our previous code does all the SCSI dirty-work of getting
to the point where the DMA transfer can take place (target shifting into
data transfer phase).

i am consfused about what programming is needed on the 5380 SCSI control
chip. the process right now is:
1- set up DMA base address and byte count
2- set DMA for "read" in control register
3- program 5380 to be in DMA mode, but not block DMA
(mode register bit 1 set, 7 masked)
4- assert data bus on 5380
(initiator register, bit 0 set)
5- set data mode on 5380 (in this case a READ from TAPE to RAM)
(dma target receive register, any write)
6- start DMA process
(control register, bit 1 set)

this returns a busy-error on the SCSI bus status register, and nothing
is transfered. does anyone have a working method for doing DMA transfer
to and from a SCSI device?

If you install a new disk icon giving it the letter "c" (small), when you
click on it the window comes up with the title "cartridge"!

Maybe the cartridge can be accessed as a filesystem!?

Mike:

First, there is no such thing as TOS 1.3. It sounds like you have
1.0 or 1.2. What you are experiencing is called the Fat Search Bug.
On all TOS's before 1.4, you need a program called FATSPEED.PRG, wich
you should be able to find on atari.archive. Make this the first
file in your auto folder (it has to be first or it won't install
properly), and it will cure the problem. I had to use it for three
years, until I got my Mega STE, which doesn't require it.

Hope this helps!

Rob

This locking up means you really can't do anything during 5 seconds? Otherwise
it might be the ICD write cache - try putting it off. (or am I being dumb now?)

Not to mention that with VDI, you can use a smaller GDOS font (as done in the GEMINI console window).

1470. need informations about the MIDI interface...

Newsgroup: comp.sys.atari.st.tech
Date: 1992-04-09 14:00:20 UTC
From: charles@aurora.unice.fr
Message-ID: <1992Apr9.140020.22096@taloa.unice.fr>
Source record: 44718

Hi atari users...

I look for informations about MIDI. Does it exist a ftp server or
something like that where I can find the complete (or incomplete !!!)
dscription of MIDI (some examples a welcome.......).

It's really very important.......

Please mail me if you have any informations.........

Tony / charles@aurora.unice.fr

> steve@thelake.mn.org umn-cs!thelake!steve
>----------

I have the source for the MiNT library but have not had the time, nor
the know-how to build it. It would be nice if someone could upload
a heat-n-serve MiNT lib for sozobon.

On another point...
Why doesn't sozobon put the name of the program in argv[0]? Everytime
I try to reference argv[0] all I get is "".

main(argc, argv)
int argc;
char *argv[];
{
printf("%s\n", argv[0]);
}

All this program does is print a blank line.

To everyone who has responded,
Thanks for all the help!
Randy Hosler

Do you have an alternative?

Your points are valid, but they do little to solve the problem. Making a status bar that does not flicker is not a simple matter without the Line-A. Most people that use MiNT will also use a terminal emulator that they can run in the background as well, since that would allow them to have background file transfers. One way to solve the problem would be to make the status bar an option. You can have it or, if you are using MiNT and need to avoid conflicts, you can not have it. As for an uncontrolled termination, that should never happen within the program. The only time it could happen would be at start-up or when another program is spawned. Both situations are easy enough to avoid. If you are multi-tasking the problem becomes more serious. Another task might bomb-out, leaving you in the lurch. Still, that is a possability that cannot be avoided. As for re-direction, you can't re-direct this program. It is GEM, not TOS.

Anyway, if you have an alternative, I would be glad to listen to it.

The easy way to do this is to find someone with a MagicSAC or Spectre
cartridge holder.
(Magic sac for 64 K roms only)

The Spectre allow you to read the roms FA0000-FBFFFF; FC0000-FDffff

The only problem is the five bits are scrambled a bit: sort of like:

15 14 13 12 11 10 09 8 7 6 5 4 3 2 1 0 ROM
reads in as
15 14 13 12 10 09 11 8 7 6 5 4 3 2 0 1 ROM

This may not be exact (but close). I have the facts and a copy program
at home.

Remember that 1 ROM has either all the even bytes or all the odd bytes.
Thence FC0000, FC0002, ... FDFFFE is on one ROM
and FC0001, FC0003, ... FDFFFF is on the other ROM

1477. Repost - MegaST (not STe) Bus Connections

Newsgroup: comp.sys.atari.st.tech
Date: 1992-04-09 23:35:52 UTC
From: rdt154k@monu6.cc.monash.edu.au
Message-ID: <1992Apr9.233552.25162@monu6.cc.monash.edu.au>
Source record: 44725

As there has been some discussion on the Mega ST internal bus of late
the following post briefly details the bus connections and what each
pins function is. Refer to any MC68000 data book for more info.
What is presented has been abreviated slightly but no
vital information was edited out. The whole document runs for about 10
pages, most of it esoteric, dealing with Atari's reasons for the bus and
copyright info plus a lengthy Introduction on the design of the bus. No real
information. Hope this is of help. If you have any queries please don't
hesitate to call me. Best of luck.

As to whether this is legal or not - I don't know. If problems do arise
as to the legality please inform me as I don't want to cause any serious
problems. Some parts are copied (ie; typed in by hand, by myself) verbatim
from the original documents.

---------------------------<cut here>---------------------------------------

Atari Mega ST internal bus.

Mechanical Description:

Two sizes of expansion card are supported. One, the half card
is half the depth of the Mega St unit. The other, the full
card is the full depth of the unit. In either case, the card
butts up to the rear panel of the St unit which has been provided with a
removeable hatch through which connectors and/or cables can be mounted.

The expansion card connects to the St motherboard through a 64
pin connector mounted on the bottom (solder) side of the expansion board.
This connector plugs directly into its mate mounted on the motherboard.
Standoffs, 25mm in length, are mounted into the bottom case through the
motherboard. the expansion card is then screwed down to the standoffs.
The standoffs and screws are not supplied with the Mega St and thus should
be included with the expansion card. A hole located in the left rear of
the expansion card fits around a plastic stud to provide extra strain
relief for rear mounting connectors (See diagrams).

Electrical Description:

The signals provided on the 64 pin connector are essentially the
pins of the 68000 processor. These signals are all unbuffered. They are
intended to drive one LS TTL load on the expansion board. driving more than
one load or driving excessive capacitance may cause imporper St operation.
For this reason it is not acceptable to connect to the expansion connector
in any manner other than the one outlined in the previous section (e.g.
connecting directly with a cable is not acceptable.

The bus may be arbitrated away from the processor using the normal 68000 protocol. However, the bus grant signal provided on the connector is the end of the daisy chain. Response time will be effected by the DMA going on in the system (e.g. disk activity, hardware bit-blt transfers, etc). If the peripheral requires DMA to occur while interrupts are enabled, care must be taken to limit the transfers to bursts of less than about 50 bus cycles allowing adequate time between bursts to process the interupts.

The timing of the bus is that of any 8Mhz 68k processor. Since the signals provided are essentially the processor pins, connecting peripherals in the same manner as you would to any 8Mhz 68k should work with no problem. DMA is the exception. The bus cycle produced even while the bus is arbitrated away from the processor must look exactly like an 8Mhz 68k bus cycle. This constraint is necessary to provide the proper sharing of the memory between the processor and the video. In all transfers, DTACK must be provided/sampled as required by the 68k processor specification. Also, transfers may not last more than 64 clock cycles. The St will automatically generate a bus error if AS is held low for more than 64 clock cycles.

The following diagram shows a top view of the connector on the motherboard with its associated pin numbers and signal names. This connector (TRW no. 009-00002-8, JAE no. ME03-R64P-D4T2-A1 or equivalent) is the male side. The expansion board uses the female side (TRW no. 009-00005-6, JAE no. ME03-64S-D4R1-A1 or equivalent).

<front of ST rear of ST>

Top view of motherboard connector.

The following is a brief description of each signal on the connector.
For more detailed info consult a 68000 processor manual.

CLK

This signal is an 8.0106Mhz TTL compatible, 50% duty cycle square wave.

/RESET, /HALT

In combination these two signals can be used to indicate a system
reset. The /RESET can be used by itself to indicate a system or s/w
reset (RESET instruction executed). These are both bidirectional
(open collector) signal terminated on the motherboard with a 1K and
a 4K7 pullup respectively. They may be driven according to standard
68000 processor timing to acheive the functions of the 68000's
/RESET and /HALT lines.

A system reset will occur at powerup and any time the reset switch
is pressed. It causes both lines to go low for at least 1ms. A
software reset will cause only the /RESET line to go low for
approximately 15us.

A1-A23

These lines provide the 23-bit address directly from the 68000
processor. Terminated with 4K7 pullups on the motherboard.

D0-D15

16 bit bidirectional data bus. Terminated with 10K pullups on the
motherboard.

FC0, FC1, FC2

These lines indicate the processor status for the current bus cycle.
They are directly driven by the 68000 processor. Terminated by 10K
pullups on the motherboard.

/AS

When low, indicates valid address on address bus. Terminated with
4K7 pullups on motherboard.

R//W

When high, processor is doing a read. When low, processor is doing
A write. Terminated with 4K7 pullups on motherboard.

/UDS, /LDS

/UDS indicates upper 8 bits, ie; D8-D15. /LDS indicates lower 8 bits,
ie; D0-D7. Terminated with 4K7 pullups on motherboard.

/DTACK

Bidirectional signal used to indicate a completed data transfer.
Terminated on motherboard with a 1K pullup

/BERR

Used to tell the processor or DMA device that no peripheral device
has reponded to the current bus cycle. The ST will automatically
generate this signal if a bus cycle does not complete within 64 clock
cycles. Terminated on motherboard with 4K7 pullup.

E

Enable clock used for 6800 peripherals. 60/40 duty cycle.

/VPA

Open collector line used to indicate that a 6800 type cycle should
be executed. Terminated by 4K7 pullup.

/VMA

This signal is used to synchronise 6800 type bus transfers with the
E clock.

/BR

Indicates that the bus will be released at the end of the current
bus cycle. This signal is daisy chained through the other DMA
devices on the motherboard, it does not come directly from the
processor.

/BGACK

Open collector signal used by a DMA device to claim bus mastership.
Terminated by 4K7 pullup on motherboard. Should also be terminated
on expansion board with another 4K7 pullup.

/NMI, /INT-5, /INT-3

These signals are used to asynchronously generate a level 7, level 5
or level 3 interrupt. These are the only levels which can be generated
externally. If they all occur simultaneously, the highest priority
(level 7) will be acknowledged first. The expansion card is responsible
for responding to any interrupt acknowledges for interrupts which it
generates. These acknowledges can be either vectored or auto-vectored.
All three lines are terminated by a 1K pullup on the motherboard.

Power:

Power is supplied to the expansion card through a pigtail cable which plugs onto a six pin connector on the motherboard. The connector on the mother-board is AMP no. 171825-6. The mating connector on the pigtail from the expansion borad is AMP no. 171822-6. The drive capabilities are as follows;

PIN 1 - +5VDC @ 750mA
PIN 2 - +5VDC
PIN 3 - GND
PIN 4 - GND
PIN 5 - GND
PIN 6 - +12VDC @ 500mA

Software Considerations:

The mediation of available addresses should not be necessary since only one expansion card may be plugged in at any one time. Atari has set aside the addresses C00000 through CFFFFF, FF0000 through FF7FFF and FFFE00 through FFFFFD for use by outside developers. Spurious accesses to FFFFFE/FFFFFF may be generated.

You can't add RAM which will work as video memory and/or will allow DMA. Also if memory is extended on the expansion card, the operating system will not clear it or allow it to be allocated.

Well, I can move the mouse while I'm waiting, but I can't do anything else.
The problem is just in Atari's FAT search routine - it is very slow with
anything bigger than a floppy disk. Several people have told me to get a
utility called "FatSpeed" which will fix the problem...

>(adamd@rhi.hi.is)

Hey wow! My guess was right? I've heard people talking about the "dubious"
nature of the Atari Media Change implementation, but I don't see the problem.
I mean even with write protected floppies, unless you can pull that disk out
and shove another in there in less than 1/60th of a second, the write protect
status will change, right? Are there more details I need to know to
understand? I figure the checking routine must count more than one pulse in
order to determine the media change because I've seen that function call that
returns the "a media change has occurred", "a media change has probably
occurred", "a media change has definitly not occurred". Weird!

Hello,

Could somebody give me his/her opinion about the best archiver for the ST? Is is LHarc, Arc 6.x, Zoo 2.1? XLHarc? I will probably want to use it under MiNT as well as under TOS. I suppose I could go home and pack my HD with every one of them and see which archive is the smallest, but I reckon somebody must have done a similar thing already.

Thanks!

Mickey, (and anyone else interested)
I have have read your files and they are excellent! I had an idea to possibly simplify the process though. Now, I really should try this before speaking, but hey, I'm impulsive and irresponsible ;^)

Wouldn't it simplify the process if instead of cutting and modifying the existing drive B cable (assuming you have one) you opened the case of the ST and tapped onto the internal ribbon cable (the one attached to the internal floppy) using a daisy chain type thing? Like:

```
/-------------[]< card edge to external floppy
|
--------[][]------------[]
Internal Cable ^ ^male end ^female end to internal floppy
```

I just say this because ribbon cable is so much easier to work with than just about anything, just using a vise, pliers, or vise grips to press the ends into place. You would then have to change the Drive select jumper on the external from 1 to 2 (or from 0 to 1 depending on labels used).

One would probably want to hang a ribbon header out the back of the ST case to allow for disconnection.

Do you think it will work?

Regards,
Doug

I remember seeing on one of the ST Formats (on the PD section) a program
that converted Amiga files to Quartet. What's the name of the program ?
And what formats does it convert ? Does anyone have this program or knows
where I can get it ? Any Librarys in Uk carry it ?

[In article <18420017@hpsad.HP.COM>,
randyh@hpsad.HP.COM (Randy Hosler) writes ...]

> I have the source for the MiNT library but have not had the time, nor
> the know-how to build it. It would be nice if someone could upload
> a heat-n-serve MiNT lib for sozobon.

It's not hard to make one. You need the current collections of source code and include-files from atari.archive.umich.edu. There is a makefile in there that works with Heat and Serve's MAKE.

Be sure that you have the LIB and INCLUDE environment variables set to point at the directories in which you have stored the MiNT stuff, not the Sozobon stuff.

I ran across two fairly minor problems:

-- in termcap.c, tgetent is declared as returning a char*, but it really returns and int and it's declared as such in termcap.h. The compiler notices the inconsistency and chokes. Fix the source code.

-- doprnt.c simply overwhelms TOP, the optimizer. Just compile this module separately before running MAKE. Use the command cc -c doprnt.c.

Then run MAKE and go eat a sandwich or something, because it'll take awhile.

You'll wind up with a libc.a and a crt0.o that can replace dlibs.a and dstart.o.

> On another point...
> Why doesn't sozobon put the name of the program in argv[0]? Everytime
> I try to reference argv[0] all I get is "".

This is interesting; I hadn't noticed it, and I don't know what Ian has done to the argument-parsing code, since I don't have sources.

I'll record this as an apparent bug, with reservations (see below).

It does not appear when I run a test program from a shell, but it shows up from the Desktop. Programs compiled with other versions of dLibs (available from a.a) can find argv[0] under both circumstances.

The whole issue of args is a can of worms, but since you've opened it, let's drag a couple out and examine them.

There are several ``standards'' for passing arguments under GEMDOS. The most basic is the GEMDOS Pexec function, but it is deficient in

two ways: it provides only a short ``command tail'' and does not tell the child program its own name.

Various solutions to these problems have been implemented by C compiler writers. Most involve tinkering with the environment, mucking around in address space that doesn't belong to the program, or both.

dLibs argument-processing code implements one such solution, called XARGS. If you run your program from a shell that supports that standard, then you'll have something sensible in argv[0].

The original dLibs code tried to use XARGS first, and if that failed, it retrieved argv[0] by using some black magic. The Heat and Serve package apparently has abandoned that attempt, and I suspect one of my own bug reports may have prompted that change. The black magic method was known to occasionally produce problems with Micro RTX and older versions of MiNT, and that's why I took note of your report as a bug ``with reservations.''

Atari Corp. officially endorses a newer standard for passing extended arguments, called ARGV. The MiNT library supports ARGV. If you compile your program with the MiNT library AND execute it from a shell or other program that supports ARGV, then you'll get something sensible in argv[0].

Unfortunately, Atari does not support ARGV in its own Desktop, at least not in versions up to TOS 1.4. Since the GEM Desktop does not provide a mechanism for creating long command tails, it might seem at first glance that ARGV isn't important, but ARGV also provides a dependable method of obtaining argv[0]. A program compiled with the MiNT library, using Atari's officially supported protocol, still can't find its own name when run from the Desktop.

I don't know whether this is still true with the Mega STE's and TT's NewDesk. Maybe someone who's used them can comment.

If you're interested in the innards of the ARGV specification, send me a note and I'll mail you a text file explaining it in detail.

In article <1992Apr10.105841.8267@sci.kun.nl> vince@sci.kun.nl (V.G.J.M. Stoks) writes:
>What about this new SM144? Is it any good? Should I wait for the newer
>SM146 to arrive in the shops? Anybody tried it with Overscan or
>PixelWonder?

i don't know about these, but just an hour or so ago i drove over to Toad
and picked up an SM147 mono monitor (they told me my beloved SM124 is not
made any more...WAAAHHH!).

the '147 appears to be a mono super VGA monitor (that's what the manual it
comes with sez). it is 640x400 with about a 245x170 mm display area (measured)
or about 11.75 inch diagonal image. this makes it about 10-15% larger image
(not more pixels, just bigger). the image takes up all but about a 1/4 inch
margin on the screen. the manual calls it a 14-inch Super VGA monochrome
monitor and i think it was really written for PC or PS/2 users. it has an
atari logo on the monitor, however. i don't know how they come up with 14"
though.

big minus is there is no sound at all. i suppose there is a solution, but
i don't know it nor do i need it particularly.

the brightness and contrast controls are at the front as is the power sw.
the back has knobs for V-SIZE (expand/contract vertical) and H-PHASE (hor
image position) control and screw pots for sub-brightness and focus. mine
needed minor focus adjustment. having all these controls accessible without
openning the unit is a plus.

when i saw it in the store, the image jittered, but at home it seems fine.
they told me it was probably local electromagntic fields. ok. i only saw
the desktop for 10 seconds (go right for gulam :-) but it seemed ok.

the image is not quite as crisp (i can't do side-by-side since my 124 died
finally) but it is not too bad for text. the right side of the screen seems
slightly darker than the left (it just might need some adjustment). black on
paper white (and it is white tho it had a green tinge in the showroom under
fluorescent lights). at home under incandescent it is fine.

i tried my mgif program with it to view some GIF images and it did not seem
quite as good, but not that bad either. could just be my particular choice
of images, so i'll try some others that i remember more vividly.

it comes with a swivel stand, but i just put it on top of my "stack" with
no base since this is the proper viewing angle for me. there is about 3/16"
clearance under the monitor so some air can get under. i raised it with an
additional 1/4" of spacers anyway to get more air to the Megafile60 it sits
on.

i shelled out about $198 for it (with MD tax). i think the price with a trade in is around $125 or so.

so far i like it. the image is larger and the picture is very good (i rate the SM124 as "excellent" tho small). anything is better than med rez anyway if all you do is sit in front of a vt100 for 10 hours a day. no sound is a bummer, but i am getting used to it.

oh, the case is med-dark gray (does not match the mega4 or 1040 case color), if that matters...

1487. help... recovering "formatted" drive, anything like Norton Utilities?

Newsgroup: comp.sys.atari.st.tech
Date: 1992-04-10 21:44:57 UTC
From: chang@ADELPHI-ASSB01.ARMY.MIL
Message-ID: <9204102144.AA00876@adelphi-assb01.army.mil>
Source record: 44735

While trying to clean up my sh204..

I hooked up my atari SH204 (20 meg) to the DMA out on my toadfile 85 (icd host adapter, seagate drive), I changed the 204' scsi id to 1, (the toadfile like most hd packages default to 0), everything was fine.

The toadfile 85 has 6 partitions of ~ 14 meg, I moved everything to the upper 3 partitions and copied the three partitions of the 204 to the lower 3 partitions. All good and fine..

Then, I used the hdx that came with the 204, dated March 27 1986 (BAD MOVE) and proceeded to format HD 1 (changing the value from the default 0). Well, then the wrong light is blinking. My toadfile blinks for ~ 10 seconds and then the first 3 partions have been zeroed. I say this coz tho' hdx was supposed to be formatting, it blinked too short to have taken out 40 some meg, coz it left the bottom 3 partitions untouched. Well, the c,d,e partions now have 0bytes 0 items, also the partition size has changed from all 14 megs to something like 40 some, 5 , and 10 meg.

I'm sure the data is there, and I'm fairly familiar with how floppies are set up with the FAT and all, but I'm in the dark with regards to how HD's are setup. Where do you look to see what partitions there are? I suppose that would tell me where the FATS are too. Is it possible that the place that describes the partitions was cleaned up and the actual FATs are still there? The whole thing wasn't wiped out coz all the data on the bottome 3 partitions are good.

This was on a 1040STe w/ tos 1.6.

Help. please...

Thank you

Fo

It is absolutely *not* the effect of using the write cache, because I'm
using the ICD software and its caches with great performance.
First of all, I recommend a new TOS version, preferably KAOS 1.4.2 or
TOS 2.06. If this doesn't solve the problem, it could be a software or
hardware configuration problem, but I cannot imagine what sort of.

while we are on the subject of portability, is using Physbase() to twiddle pixels considered portable these days? it is a documented Xbios function. what about _v_base_ad ($44E)? again a documented "guaranteed not to change" system variable. if not, why? please don't tell me "because some add on graphics cards only grok VDI". they are the ones breaking the rules as i see it if this is the case. will either of these work on a TT? i believe MiNT still defines Physbase() in <osbind.h> (correct me if i am wrong) so that this should work under MiNT at least. what does the TT developer's docs say about Physbase and v_base_ad? are these ok? does this function and variable exist in the TT TOS? in the same location as other TOS versions? since it is doubtful that i will ever have a TT or add-on graphics card, i really could care less for my own use. however, if i could make a program portable with relatively little effort, i'd like to know. otherwise, i will stick to accepted/sanctioned 1990 and earlier programming practice (line A, Physbase, etc).

i can understand not using line A since the TT does not support it (eventho this has previously been condoned by atari, even encouraged [see Dec 17, 1989 S.A.L.A.D. docs]). not having access to Xbios or system variables is just plain unacceptable in my book. these were something we were supposed to be able to rely on from 1985 onwards. progress is one thing. major changes to common (at least by me) programming practices is another.

what are the acceptable methods of changing system fonts, without GDOS or equivalent? do the VDI functions work without GDOS? is there any way to change fonts in a portable way without GDOS or VDI? how are fonts loaded on the TT? does it come with GDOS or equiv? does the TT have a termcap-like capability? vt52/vt100?

in lieu of all of these methods, can someone post self-contained, portable routines to draw lines and set pixels? something like:

```
void draw_line (int x1, int y1, int x2, int y2);
void set_pixel (int x, int y, int on_off);
```

i don't want to open a workstation anywhere else in the code. doing this with both line A and Physbase is trivial, well documented, localized to small areas of code, and fast. i am thinking monochrome, but a color solution would also work. can these be implemented like this:

```
void set_pixel(int x, int y, int on_off);
{
open_worstation();
do_pixel(x, y, on_off);
close_workstation();
}
```

ie contain all the VDI functions in one routine. i realize this would otherwise be painfully slow, but at least a check can be made for "standard" config to bypass the VDI trash. this means that the workstation would be repeatedly openned/closed each time graphics were needed. text could be positioned with normal vt52 (curses/termcap/whatever).

i ask these questions because i want to make some major changes to my mgif, manpager, and nroff codes. they were posted in sort of a reasonable tho somewhat hackish form and i want to try and improve them if i can find the time. how is the screen driver for ghostscript written? is it portable (ie run on TT and special graphics cards)?

Does any one know what this problem is..!!

I am connecting to a System that uses C-Kermit 4E(072) 24 Jan 89, Vax/VMS

The problem that I am having is on uploading, the system will
not close this file, ie, unable to close file..

The File is a Larc lh1 type archive of 8064 bytes, when the system
does close the file manualy it ends up 384 bytes short, ie, 7680 long..

I changed the file name and patched the Directory to make the file
one byte bigger but with the same problem..

I can upload similar files ok..!!

I also tried a different Kermit, same problem..

Please can any one help me...Thanks..

>*** Kapiti At least I don't Flicker, ***
>*** New Zealand.. * not like a dying light globe ***

The problem comes from the way a Vax deals with files that are note text.
Any file that may either be executable, or which might need to have its
contents extracted (an ARC file is an example of the latter), should be
transferred into the Vax as FILE TYPE FIXED. But that is only part of the
solution (a part C-Kermit solves by converting all Binary files into FIXED).
In addition the File that gets created on the VAX (VMS file system?) needs
fixed-length records (default of 512 bytes each). If the file is not a
multiple of 512 bytes in length, part of the file (the remainder of the
last 512 byte record) will be truncated. I've gotten around this problem
with a kludge. I use VAXARC.EXE (compatible with ARC.TTP (v. 5)) to
compress files before sending and always aadd the file zzzzzzzz.zzz to the
archive. That file is 1754 bytes of a-z repeated a number of times. This
always compresses to increase the archive by a little over 512 bytes. The
archive can then be unarced on the vax, with only the garbage file damaged.

I got VAXARC from CompuServe (but you could get it or ZOO from DeCus).. I
had to upload it through Vax Kermit (not C-Kermit) with SET FILE TYPE FIXED
on the Vax end and FILE TYPE BINARY on the ST. In VMS-Kermit (v32?) the
transfer is much slower (no extended packets) but the truncation problem
doesn't occur (at least for me).

Just try the getopt() function from DLibs 1.2. It supports the Unix like argument parsing with correct argv[0] implementation. It is very simple to use (have a look at the sources coming with DLibs) and makes your programs almost fool proofed.

It's not sozobon's fault; in TOS'es at least up through v1.4, you can't get argv[0] through the official channels. (It's not there, and many of the methods used for retrieving an argv[0] would make things go boom under Mint, as well as having other attributes that made the Atari Software Engines [Hi Ken!] unhappy.) Find a shell that uses the (official?) Atari extended argument scheme and you may see argv[0] filled in.

1494. FZDT & GVC modem auto baud change

Newsgroup: comp.sys.atari.st.tech
Date: 1992-04-11 17:32:13 UTC
From: jesa@gun.do.open.de
Message-ID: <H.v1iepAJNpS2@gun.do.open.de>
Source record: 44742

Hello
This is my first ever news posting - "So a new era begins!"

Baud Change Problem
****

I am using FreeZe Dried Terminal V2.12 with a GVC 9600 V.42bis/MNP5 modem.
I have my terminal set at 9600 baud as the default. If I make a connection to
a BBS that can only use 2400 baud - the modem auto senses this and switches
baud but all I get on the on-line screen is random characters. Even if I then
set the terminal settings to 2400 there is still no readable output on
screen. I know I can set the autodialer to diferent baud settings for each
individual number but it would be nice if the auto baud sensing worked.
Does anyone know if this is supposed to work or if it is just wishfull
thinking on my part.

Any help or advice appreciated - Also anyone using FreeZe Dried Terminal who
has any other problems - I would be interested to hear from you.

Reply by Email or follow up.

>pixels considered portable these days?

That depends on what you understand 'portable'. A truely portable GEM application may not call anything but AES and VDI functions for graphics. In particular, it may _never_ write directly to the screen (and there's no GEM call to find out where the screen is). There might even some day graphics cards where you can't access the frame buffer from the CPU at all (like cards that connect to the SCSI bus, as on the Mac).

>it is a documented Xbios function. what about _v_base_ad ($44E)? again a
>documented "guaranteed not to change" system variable.

_v_bas_ad is guaranteed to point to the start of the physical screen memory on the system. But this is a low-level call. With a graphics card installed, it might point to a _different_ screen that is visible to the user (in particular to the built-in). Or it might really point to the screen, but you don't have any information about size and format...

Come on: using XBIOS or Line-A for graphics is simply wrong. You should never mix different OS layers, and you should always try to use the highest level (in application programs). You wouldn't use Rwabs() to access files on your harddisk, or would you?

It's sad that there are no clear words from Atari about that. But it's obvious.

>if not, why? please don't tell me "because some add on graphics cards only
>grok VDI". they are the ones breaking the rules as i see it if this is the
>case.

Please understand that some features of the low-level graphics interface simply can't apply to graphics cards (like the assumptions that Line A does about the max. number of planes (4) or the organization into bitplanes).

>will either of these work on a TT?

Be assured that all cards that plug into the VME bus work fine with their drivers on the TT.

>i believe MiNT still defines Physbase() in <osbind.h> (correct me if i am
>wrong) so that this should work under MiNT at least.

OK. Let's say that you indeed get a 'screen pointer' (which isn't true with some cards). How do you use this information? You have no guaranteed ways to find out about the plane format (unless you don't want to support

anything that has a different format than the standard shifter format).

>what does the TT developer's docs say about Physbase and v_base_ad? are
>these ok? does this function and variable exist in the TT TOS? in the same
>location as other TOS versions?

The docs say nothing. This means: the old informations are still valid.
You CAN use this variables. But your programs WON'T run on add-in cards or
future Atari hardware. Simply because these informations aren't just
enough to access the screen.

>since it is doubtful that i will ever have a TT or add-on graphics card, i
>really could care less for my own use. however, if i could make a program
>portable with relatively little effort, i'd like to know. otherwise, i will
>stick to accepted/sanctioned 1990 and earlier programming practice (line A,
>Physbase, etc).

If you are just programming for your own, do what you want to do. But
using Line-A or XBIOS for graphics is just silly. Remember the Rwabs()/
filesystem example.

>i can understand not using line A since the TT does not support it (eventho
>this has previously been condoned by atari, even encouraged [see Dec 17,
>1989 S.A.L.A.D. docs]). not having access to Xbios or system variables is
>just plain unacceptable in my book. these were something we were supposed
>to be able to rely on from 1985 onwards. progress is one thing. major
>changes to common (at least by me) programming practices is another.

It's Atari's fault that they don't manage to tell the programmers about
good ways to do things. But we _have_ to get rid of these interfaces;
simply because they can't work correctly with modern hardware (new chips)
or new software (multitasking).

>what are the acceptable methods of changing system fonts, without GDOS or
>equivalent?

There is no documented way. If you _really_ want to do this, put it into
a small utility program, not into an application (btw: you can do it by
replacing the screen driver, NVDI does this).

>do the VDI functions work without GDOS?

Yes (most, some restrictions apply).

>is there any way to change fonts in a portable way without GDOS or VDI?

As long as you want to output the font via VDI: no.

>how are fonts loaded on the TT?

With GDOS. The same way as on all TOS machines.

>does it come with GDOS or equiv?

No.

>does the TT have a termcap-like capability? vt52/vt100?

Exactly as a normal ST.

>in lieu of all of these methods, can someone post self-contained, portable

Well. Why would you want do to that. Why not just open the workstation on
start and close it when the program terminates?

>i realize this would otherwise be painfully slow, but at least a check can
>be made for "standard" config to bypass the VDI trash. this means that the
>workstation would be repeatedly openned/closed each time graphics were
>needed. text could be positioned with normal vt52
>(curses/termcap/whatever).

Nope. You can't mix BIOS/GEMDOS text output with graphics. You have _no_
information where BIOS and GEMDOS output goes. With Gemini or MW, it might
go into a window. The 'console' is not necessarily identical with the
(full) screen you can access with VDI.

Hope that helps.

Zoo 2.1 shows (together with LHarc 2.0*) the best compression rates. LHarc
is a bit faster as zoo, but has some bugs which could leave you with defective
archives...
So I normally use zoo, (for it has the advantage of using the GNU-UNIXMODE,
too) but I have all archivers on my harddisc - even I only use them to depack
archives I get and repack them with zoo afterwards...

I have been watching this thread since the beginning now waiting for -THE ANSWER- But of course, there has been no one answer. It seems that according to all I've read, there is no "legal" answer. But wouldn't one solution be to include with the software, TOS or machine specific driver(s) that can be chosen either automatically by a system "sensing" routine or chosen from a setup menu? I mean this is how some PC applications approach different VGA card usage. In fact most device specific PC applications require some type of driver software. Why should ST/STe/Mega/TT/Falcon/Etc, be any different? This way you can make the screen a line shorter any way the programmer chooses, then additional drivers can be added as needed for different machines, frame buffers of TOS versions. I mean come on! I'm not allowed to write any software unless I buy one of each type of frame buffer, screen accelerator and platform that exists to test for compatibility?

Or is this just a philosophical discussion and I'm missing the point?

Regards,
Doug

Get an ST term program that supports ANSI graphics. I use Flash 2, which
seems to work ok, although ANSI graphics slows down the throughput a LOT
and I usually tell the BBS to kill the ANSI nonsense. I seem to recall
at least one shareware term program that does ANSI "graphics".

i was not asking about a portable _GEM_ program, just a portable _TOS_
program. it appears that these are not necessarily the same thing.

>In particular, it may _never_ write directly to the screen (and there's no
>GEM call to find out where the screen is).

I thought Physbase, by definition, tells this as does the _v_base_ad sys
variable? why then do graphics cards break the rules? surely this info
must be memory mapped somewhere, so that an address can be found, albeit
in some contorted fashion depending on the sys config.

>There might even some day
>graphics cards where you can't access the frame buffer from the CPU at all
>(like cards that connect to the SCSI bus, as on the Mac).

there also may not be GEM any more. how far do you want to carry the future
argument?

>_v_bas_ad is guaranteed to point to the start of the physical screen
>memory on the system. But this is a low-level call. With a graphics card
>installed, it might point to a _different_ screen that is visible to the
>user (in particular to the built-in). Or it might really point to the
>screen, but you don't have any information about size and format...

so is there a method to find this address for every graphics card (even if
different for every card)? and why is _v_bas_ad not what it is supposed to
be? as i read my docs, they all say this is the address of the screen. if
i write to this address, i should get something in the upper left corner.
is it possible to tempararily install a different screen driver?

>Come on: using XBIOS or Line-A for graphics is simply wrong. You should
>never mix different OS layers, and you should always try to use the highest
>level (in application programs). You wouldn't use Rwabs() to access files
>on your harddisk, or would you?

i am not mixing layers. i am using GEMDOS and XBIOS only. if you like,
i can trash GEMDOS and just use BIOS and XBIOS (tho without GEMDOS, file
access would be for all intents impossible). i won't even use line A.
and no, there is a function to access harddisk via the file system provided
by GEMDOS. i have a choice, and in that case choose simplicity (Fopen).
i also have a choice with graphics (Physbase, Line A, VDI) and i also choose
simplicity here as well. do u really consider GEMDOS/BIOS/XBIOS to be
different layers? i agree that VDI is a different layer and AES is, too.

>It's sad that there are no clear words from Atari about that. But it's
>obvious.

agreed. but NOT obvious. how can it be obvious if there are no clear words?

>Please understand that some features of the low-level graphics interface
>simply can't apply to graphics cards (like the assumptions that Line A
>does about the max. number of planes (4) or the organization into
>bitplanes).

in this case, i could tailor my programs with switches like "-display 640,400"
and "-planes 4". this would allow "normal" users (with "standard" monitors)
and "special" users (with funky stuff) to all use the program. the alternative
is to simply write for myself. if i ever again plan to write a commercial
product, of course i would approach this differently.

>>will either of these work on a TT?
>
>Be assured that all cards that plug into the VME bus work fine with their
>drivers on the TT.

i was refering to Physbase and Line A. i think the latter is out, but does
the TT support Physbase?

>The docs say nothing. This means: the old informations are still valid.
>You CAN use this variables. But your programs WON'T run on add-in cards or
>future Atari hardware. Simply because these informations aren't just
>enough to access the screen.

ok. this is what i wanted to hear. i also believe that GEM will be gone
anyway within 5 years, replaced with X. in any case, a GEM program will
not run nor will an XBIOS program. only i can develop the latter in 1/3
the time.

by the way: how do games do their thing? i can't possibly believe that
games use only VDI and AES. i have to believe that they go for lower level
stuff since speed is critical (realtime). do games run on the TT or on
special graphics cards? if so, how do they do it?

>If you are just programming for your own, do what you want to do. But
>using Line-A or XBIOS for graphics is just silly. Remember the Rwabs()/
>filesystem example.

this is an apples to oranges comparison. nobody accesses disk normally
via Rwabs since there already is a documented file system. there are also
multilayer graphics support that many people use, right or wrong. only at
least they are documented. you can't fault someone for writing this way,
except perhaps to say they are nearsighted. and i'd agree. however, it
is just as nearsighted to look at GEM as the future. it is not. if atari
does not have X in the next few years, i'd say they'd be out of business
since GEM is not an open system (atari is really the only one doing GEM
these days) and X is (all workstations and above, more than likely unix
PCs en masse soon). the world wants open systems.

>It's Atari's fault that they don't manage to tell the programmers about
>good ways to do things. But we _have_ to get rid of these interfaces;
>simply because they can't work correctly with modern hardware (new chips)
>or new software (multitasking).

don't get me wrong. i do agree with you in principle. only i don't think we are yet going in the right direction. i don't think GEM is the right direction. about the only thing GEM gets you these days is a somewhat quicker understanding of the concepts behind X (events, windows, widgets, etc). that is a big step from stdin/stdout.

[about changing fonts]
>There is no documented way. If you _really_ want to do this, put it into
>a small utility program, not into an application (btw: you can do it by
>_replacing_ the screen driver, NVDI does this).

do you have any more info on the screen driver? i can't recall how this is done. this sounds interesting. can the screen driver be changed and then changed back, say during program execution? i understand the multi-tasking implications...

>Well. Why would you want do to that. Why not just open the workstation on
>start and close it when the program terminates?

yes, of course. i realized this would be as compartmentalized after i hit "send".

>Nope. You can't mix BIOS/GEMDOS text output with graphics. You have _no_
>information where BIOS and GEMDOS output goes. With Gemini or MW, it might
>go into a window. The 'console' is not necessarily identical with the
>(full) screen you can access with VDI.

no, but you could mix GEMDOS/BIOS with XBIOS, if you know the screen address.

>Hope that helps.

certainly. thanx. i think i am going to see how far i can get with MiNT and MGR. so far, MGR seems somewhat fragile. only thing is i have to MiNT-ize an awful lot of code i wrote under TOS. note that i am not GEM-shy. i have written a large GEM application (60k lines) several years ago. i just find it exceedingly tedious, difficult to debug (i am a "printf" sort of debugger :-), especially when i have so little time these days for "recreational" programming...

I think many of the graphic driver writers, having appearantly no
clear guidelines from Atari, are leaving the Physbase and _v_base_ad
stuff alone to allow developers to develop 2 monitor applications.
This is a handy feature, where menu screens don't cover what is being
worked on in the other monitor.
Why don't you just bite the bullet and write you application as a vdi
application? It's really not that much harder, and one extended inquire
should return everything you need to know. You don't have to use the aes
to use the vdi and if you're careful about keeping text byte aligned, it's
not that slow. I agree that losing one line is a real pain in the butt,
especially if your using a dial up and you have to change your term info
on every system you call to get a -more- scroll done right, but, though I
haven't tried it yet, I think a vdi screen doesn't ahve the menu bar
problem.
There are also fairly quick ways of changing the font characteristics
with the vdi, even if the vdi vt52 stuff is broken. Of course, this means
tweeking your vdi calls in assembly, but if you want fast....

Has anybody out there installed the TEC 2.06 upgrade in a circa '88 ST?

I'm considering the upgrade, and can handle a soldering iron, but would like to stay away from desoldering any chips.

How difficult is the upgrade installation?

Are the instruction easy to follow? What about the option to switch back to older TOS? Is this an additional installation.

Any comments would be greatly appreciated.

> in some contorted fashion depending on the sys config.

There are several problems with using Physbase() and writing directly to
the screen:
(1) As Julian pointed out, the number and layout of planes is not, in general,
possible to determine, so you're restricting your program to working
only in certain resolutions and with certain video boards if you do this.
(2) If you're multitasking and more than one program tries to write directly
to the screen at once, you get a mess.

(2) is why I would say that Physbase is "read-only" under MiNT, just
as the line A variables and BIOS keyboard map tables are read-only; if
more than one program tries to write to any of these things, unpredictable
results occur.

I used to really hate GEM too. It's not so bad, though, once you've written
an object-oriented wrapper to hide all the guts (and that also means that
to re-compile for X or some other windowing system you just have to change
the wrapper).

>>The docs say nothing. This means: the old informations are still valid.

I don't know Atari's future plans, but I would guess that if they decide to go with X then they'll still provide a GEM-like interface for backward compatibility. It would be easy enough (I think) to catch trap #2 and translate AES/VDI calls into X requests to a server. Digital Research even provides a product called X/GEM.

A lot of games break every time the hardware or OS changes. A lot of games cause problems in multitasking environments. They're bad examples :-).

Thanks for the replies so far folks, but alas the problem is not due to
game playing. The problem stems from not being able to do large file copies
in programs that store the files to RAM before copying to a hard drive.
As far as I can pinpoint, whenever files cross the original 2 megs of RAM
and go into the Xtra Ram boards 2 megs for storing the files between reading
of source and writing to destination, something happens.... as during the
write process I get spurious Write Error messages followed by Sense 4 errors
on the drive.
Of course I had thought it the drive or controller problem, but after
much testing with varying amounts memory being used, the logical thing is
something to do with memory.
If i load up a 2 megs of ramdisks and accs, I can copy less than 500K
of files before I start receiving these write errors, with NO ACCS or
ram disks, I can copy about 1.5 Megs of files with no problems. Anything
more and the problems begin, this is why I assume it must have something to
do with memory problems. I have not disconnected the board as I was not the
installer and hate messing with other folks work, and would much prefer a softw
are solution for disabling EXACTLY those ramchips.
Oh and this problem never show on normal file copies from the desk top
as it only loads one file into mem then copies it, but in NEODESK, VAULT,
CHEETAH, etc which load files into ram as possible and then copy, this ALWAYS
happens when the files length approach the barriers I mentioned above.
Any thoughts still appreciated,

PS. Yes I did post this problem before when I thought it stemmed from the
hard drive, but after much testing I think it is now somehow a memory problem.
How does write verify work on ICD host adaptors and software? Could it
possibly be munging this verify buffer? (as it often happens that even though
it gave an write error, I cannot seem to find anything wrong with the
written file)

I need a fast machine for Spice work. A 486/33 will do the job,
but I assume a 68030 w coprocessor will too.

Not finding a current version of Spice with Probe for the ST,
I'm considering mac emulation on a Spectre and SST-030 @33+MHz

I need Ethernet connectivity, Speed, and high resolution. Looks like
3 cards to me, using 2 slots (one for crazy-dots, one for an ethernet
adapter) and a cpu daughterboard (SST by Gadgets).

Is a slotless ethernet adapter available for the ST? (SCSI? ASCI?)
How about a driver for FTP/Telnet?

I'd rather not buy MS-Dos... Please let me know of experiences
in this area. I'm looking at Spectre GCR @ 33MHz running Spice with
a coprosessor. (Is Probe even available for the Mac?)

I am in desperate need of money and need to sell my TT.
The package includes:

TT030 Computer w/ 4MB ST RAM
50MB internal hard drive
PTC1426 color monitor
Cordless mouse
2400 Baud Supra Modem

All for the low asking price of $2100 (excluding shipping).
If you are interested, make me an offer. You can exclude
the monitor for $400.

Besides the above, you get all the other TT features like VME, LAN,
multiple serial ports, higher rez, etc.

Thanks,

Richard Hall

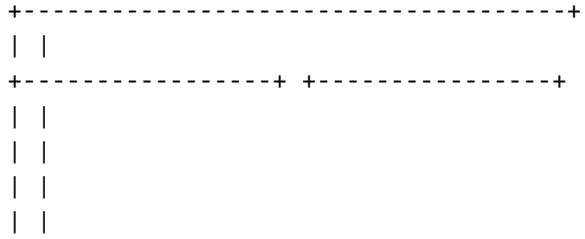
>($60 sounds reasonable to me), decent mouse to Washington, DC? Any good
>sources?
>

If you are in the DC area, you have several great ST stores to choose from. Two notable ones are Toad Computers at (401)544-6943 in Severna Park,MD, and L&Y Electronics in Woodbridge VA (My favorite). You should be able to call information in Woodbridge to get L&Y's phone number. Both of these stores should have several flavors of mice on the shelf (I know L&Y has some of the new beetle mice, very neat). You should definitely check out L&Y, there is a huge wall COVERED in ST games, and several glass cases full of the latest compilers, DTP, utilities, etc.

If/when you go to one of these stores GET A COPY OF CURRENT NOTES!!!!! This is the local area for this mag, so all the local ST dealerships advertise in it. DC is the place to be if you are an Atari owner (my parents live up there, and I always bring LOTS of cash when I visit). You will also find lots of great stuff in their PD library (including MIDI stuff, check out Arpeggiator). Every ST owner to whom I have shown an issue has purchased a subscription (this is 5 folks so far).

Also, I suspect your mouse has the "peened button contact" blues. This is relatively common for those that really press hard on the buttons. This is what it looks like:

place where you put
your finger.



```
| |
| |
| |
| | <- plastic post
| | with squished bottom
/ \
+----+

+--+
| |
+--+ +--+ <- actual button mechanism
| |
| |
```

For this, you merely have to add a bit of height to either the button mechanism (a blob of epoxy will do it, or a couple of chunks of credit card). If this is the problem, you might want to make your next mouse one with microswitches (which seem to last longer for heavy-clickers :-).

Another possibility it that the button mechanism itself is shot. One easy way to get up and running again is to swap the right and left button mechanisms on the little board in the mouse (a bit of soldering is required). If you are using software that makes heavy use of the right button, this will not help much, but most software does not use the right one.

NOTE: this was a Golden Image mouse for a Amiga, the Yellow and Brown
wires from memory, there is a small plug inside the mouse, with the
use of a pin you can remove the pins from the connector, the pin is
use to lift up the small plastic clickers that hold these pins in..

But remove the plug first..

Greetings to the world!

I've bought me an 68881-16 copro for my MSTE for the fantastic price of
70 DM = 45 US$. At least that seems to be a fantastic price for germany.
The whole thing would be even more fantastic, if it would work, cause it
doesn't! No program recognized the copro, the tos doesn't set the cookie
and every byte-access to it's adresses is responded with two bombs. I think
I've heard rumors that a GAL in the MSTE is not working correctly (oh not
another one!), but I don't know exactly. Since my local atari-dealer has
prefered to go bancrupt, I'd like to ask the rest of the world if anyone
can help me with this problem...

Thanx in advance and bye

There is a theory which states that if ever anyone would find out what the
universe exactly is and what it is for it will be instantly replaced by
something even more bizarre and inexplicable.

There is another theory which states that this has already happened.

Message-ID: <1992Apr14.143547.112484@rrz.uni-koeln.de>
Source record: 44763

Has anyone ever heard of a Remote File System implementation to be
used from the Atari ST instead of or as addition to HD? It need not be
very fast, so it could use serial link, and the image in the server
(UNIX) does not have to be integrated into the server's file system.
Any hint to product, PD, or article would be welcome.

Yeah, I'm working on it. I hope to be finished by the weekend, depending on
homework levels; I'll drop it on a.a when I'm finished.

>Be sure that you have the LIB and INCLUDE environment variables set
>to point at the directories in which you have stored the MiNT stuff,
>not the Sozobon stuff.

Particularly since the -I parameter to cc doesn't seem to work properly. What
would be nice [read: wish list item] is a command-line option to switch between
dLibs and the MiNTlib.

The main holdup at the moment is getting Sozobon's floating point library to
cooperate with the MiNTlib, particularly its printf/scanf routines. I'll
probably just replace them with modified versions out of the MiNTlib and ship a
modified libm.a with the package.

>[...]
>Then run MAKE and go eat a sandwich or something, because it'll take

Tell me about it. I need more memory so I can do directory caching.

William Rosenkranz (rosenkra@convex.com) wrote:
>i was not asking about a portable _GEM_ program, just a portable _TOS_
>program. it appears that these are not necessarily the same thing.

OK, to make things clear. There is NO way to do portable (== portable to new Atari machines or graphics cards) graphics on the ST/TT other than by using GEM.

You ask for portable ways to do graphics without using the operating system. There are no such ways.

>I thought Physbase, by definition, tells this as does the _v_base_ad sys
>variable? why then do graphics cards break the rules? surely this info must
>be memory mapped somewhere, so that an address can be found, albeit in some
>contorted fashion depending on the sys config.

(1) The frame buffer used by the graphics hardware is not necesseraly accessible from the CPU.
(2) Even if it would be accessible: you can't access the screen RAM without knowing how it is organized.

>there also may not be GEM any more. how far do you want to carry the future
>argument?

As far as the 'original' GEM philosophy is suitable to drive such hardware (if you carefully read the VDI manual, you won't find any mention of how to get the 'screen address').

>so is there a method to find this address for every graphics card (even if
>different for every card)?

No.

>and why is _v_bas_ad not what it is supposed to be?

Because it's not possible.

>as i read my docs, they all say this is the address of the screen. if i
>write to this address, i should get something in the upper left corner.

Nobody guarantees that for other hardware. it could also be in the lower right corner.

>is it possible to tempararily install a different screen driver?

No, because the screen driver is used by the AES and in order to replace the driver, you'll have to close it first (perhaps this can be done during resolution change).

>i am not mixing layers. i am using GEMDOS and XBIOS only. if you like, i
>can trash GEMDOS and just use BIOS and XBIOS (tho without GEMDOS, file
>access would be for all intents impossible). i won't even use line A.

GEMDOS, BIOS, XBIOS and Line-A are _all_ different operating system
layers. Why do you think they are all invoked by different
traps/exceptions?

>and no, there is a function to access harddisk via the file system provided
>by GEMDOS. i have a choice, and in that case choose simplicity (Fopen). i
>also have a choice with graphics (Physbase, Line A, VDI) and i also choose
>simplicity here as well. do u really consider GEMDOS/BIOS/XBIOS to be
>different layers? i agree that VDI is a different layer and AES is, too.

Yes, that's what I think.

>agreed. but NOT obvious. how can it be obvious if there are no clear words?

It's obvious that it is better to access files with GEMDOS (rather than
BIOS or XBIOS). Why isn't it obvious that using VDI is better than writing
directly to the screen?

>i was refering to Physbase and Line A. i think the latter is out, but does
>the TT support Physbase?

Both are in, but only for the TT's native graphics modes.

>ok. this is what i wanted to hear. i also believe that GEM will be gone
>anyway within 5 years, replaced with X. in any case, a GEM program will not
>run nor will an XBIOS program. only i can develop the latter in 1/3 the
>time.

OK, that's a different topic. But you asked about portable ways to do
graphics on TOS systems. Do you remember?

>by the way: how do games do their thing? i can't possibly believe that
>games use only VDI and AES. i have to believe that they go for lower level
>stuff since speed is critical (realtime). do games run on the TT or on
>special graphics cards? if so, how do they do it?

Most don't.

>this is an apples to oranges comparison. nobody accesses disk normally via
>Rwabs since there already is a documented file system. there are also
>multilayer graphics support that many people use, right or wrong. only at
>least they are documented.

Rwabs() is documented. Line-A is documented. I don't see the difference.

>you can't fault someone for writing this way, except perhaps to say they
>are nearsighted. and i'd agree. however, it is just as nearsighted to look
>at GEM as the future. it is not.

Why would you want portable Atari applications when you don't
think that Atari's going to stay for the next years?

>if atari does not have X in the next few years, i'd say they'd be out of
>business since GEM is not an open system (atari is really the only one
>doing GEM these days)...

Wrong. Novell/DR stil makes X/GEM (on top of FlexOS) and believe it or
not, they care about existing Atari programs (if you don't believe me:
contact Digital Research Monterey).

>and X is (all workstations and above, more than likely unix PCs en masse
>soon). the world wants open systems.

GEM has still significant advantages (Bezier stuff, device indepandence when
it comes to printing...). X has advantages, too. With Multi-TOS, you can
write a X driver that allows X programs and GEM programs to coexist on the
same screen.

>do you have any more info on the screen driver? i can't recall how this is
>done. this sounds interesting. can the screen driver be changed and then
>changed back, say during program execution? i understand the multi- tasking
>implications...

You can put a self-made SCREEN.SYS in your ASSIGN.SYS file. But the
workstation remains open as long as the AES runs, so -- normally -- you
can't replace it once it is started.

>yes, of course. i realized this would be as compartmentalized after i hit
>"send".

Fine. Then, there's no problem to write these functions with VDI.

>>Nope. You can't mix BIOS/GEMDOS text output with graphics. You have _no_
>>information where BIOS and GEMDOS output goes. With Gemini or MW, it might
>>go into a window. The 'console' is not necessarily identical with the
>>(full) screen you can access with VDI.

>no, but you could mix GEMDOS/BIOS with XBIOS, if you know the screen

I've installed about 4 TEC 2.06 upgrades in different ST's. Most easyest is
the Mega ST but installing it in a very old 520 ST or 1040 ST didn't cost me
more than a half hour. Every (electrician) monkey could do it.
